Roland Garros has again acquired the world's altitude record, held at 17,881 feet by Georges Legagneux in a Morane monoplane since Sept. 17, but the former is now flying a Morane machine instead of a Bleriot monoplane and the record remains with that make. Garros' latest achievement was accomplished at Tunis, Northern Africa, Dec. 11, when he reached an altitude of 19,032 feet, approximately 3.6 miles. The flight lasted 1:11:06 and was carried out during clear weather. His previous record, which was exceeded by Legagneux, was 16,076 feet, made at Houlgate, France, Sept. 6. Legagneux's flight was made at Villacoublay, France.

An accompanying illustration presents one of the Caudron monoplanes made in France and brought to this country by the Sloane Aviation Company for its flying school at Hempstead Plains, Long Island. It is of particular interest, because it is one of the first machines of this make to be seen in this country. The Caudron line also includes a biplane and an hydraeroplane, the latter being of the biplane type. This monoplane is a small, fast machine, having wings with a steel tube main spar and with the ribs pivoted onto it. A non-lifting tail is employed, with a lateral rudder mounted above it. The fuselage is completely enclosed with a small cockpit for the pilot, and the motor is under a cowl.

The proposition of crossing the Atlantic ocean appears to have a decided fascination for aviators who are seeking additional difficult tasks. Every little while some new plan is announced for accomplishing this flight. One of the latest comes from Chicago, where it is stated J. Legaucear of Paris, France, is engaged at the Cicero field in the construction of a steam driven hydraeroplane of original design for this express purpose.

It is claimed that a model of the craft has been flown over Lake Michigan and that the in-

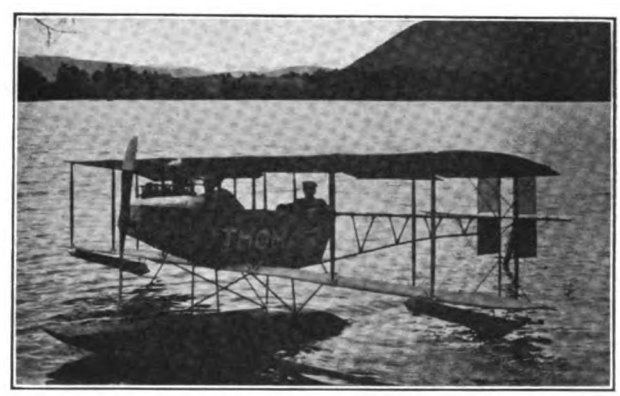
Caudron Monoplane Utilized by Sloane Aviation School, Hempstead Plains, Long Island—One of the First to Be Seen in America.

Digitized by Google

ventor is confident of success. It is to be a flying boat in every sense of the word, the hull being a bona fide boat to which a monoplane fuselage, empennage and wings will be grafted in an ingenious manner. The spread will be 100 feet, and the motive power will be supplied by coke burning steam engines.

If it be conceded that the trans-Atlantic flight will be sufficient to occupy the attention of the average aviator for some time to come, the plan to visit the North Pole, suggested half in jest by Capt. Robert A. Bartlett of the Peary polar party to the members of the Aero Club of New England at its recent annual banquet, must be considered as worthy of special mention. Alexander V. Wilson is said to have talked the matter over with Capt. Bartlett and to have evolved a scheme that is possible of being carried out.

The idea is to take along two types of aeroplanes, one light and speedy for scouting purposes, and the other heavy for the transportation of supplies and men. A vessel will take the party and machines as far north as possible, after which a scout aeroplane will fly ahead for 50 miles or so, and return to report weather and landing conditions. When it has found a suitable place, the heavier machine will convey the remainder of the party and the supplies to the new camp. By this method it is anticipated that it will be possible to make several hundred miles a day at times.



In the meantime another party is to proceed to a designated spot in the far north of Siberia, to encamp there awaiting the arrival of the aeroplane squadron. It is proposed to begin tests on the Maine coast during the present winter and start on the expedition next July or August.

South America was stirred recently by the remarkable flight of Corporal Fels of the Argentine army in a military monoplane from Buenos Ayres to Montevideo, Uruguay, across the River Platte. Corporal Fels flew down the river and across its mouth, a total estimated distance of 120 miles. He was received by the Uruguan minister of war in Montevideo, but the Argentine minister was not so enthusiastic over the flight, causing the soldier's arrest upon his return, for visiting a foreign country without permission. However, he was immediately pardoned and congratulated.

Corporal Fels belongs to a well-to-do family and is a student of engineering. He is doing military duty for one year only. In South America it was claimed that his flight was a world's record for over water. This is not true, however, as Lieut. Bague of France flew from Antibes, France, to the island of Gorgona, 138 miles, March 6, 1911. Later he started to fly from Antibes to Corsica, but never has been heard from since.

The Aero Club de France held a banquet in the Palais d'Orsay hotel in Paris early in the month, in honor of the double victory of the Coupe Internationale d'Aviation by Jules Vedrines and the Coupe Internationale des Aeronautes by Maurice Bienaime. Among the guests of honor were Henri Deutsch de la Meurthe and Comte de Lambert.

Walter E. Johnson, who is shown herewith flying a Thomas hydraeroplane, made by the Thomas Bros., Bath, N. Y., has been attracting no little attention throughout central New York State in machines of this make. The hydraeroplane is similar in construction to the Thomas tractor biplane, and is fitted with the same 50 horsepower, six-cylinder Kirkham motor, as the biplane of this make in which Johnson secured his recent two-passenger American endurance record.

Walter E. Johnson Flying Thomas Hydraeroplane at Bath, N. Y.

Baroness de Laroche of France, the pioneer woman aviator, who was severely injured during flight at Rheims, in July, 1910, and who was expected to give up flying entirely, has become the pilot of a Sommer biplane. At Mourmelon, early in the month, she made several flights of 15 minutes duration, and seemed to handle her machine with complete assurance. At the time of her accident she was operating an Antoinette monoplane, and two other aviators flew over her in such manner as to set up a number of cross currents, causing her to lose complete control of

Digitized by Google

her machine. She was dashed to the ground before she was able to right the monoplane, and as a result of the occurrence the Federation Aeronautique Internationale passed stringent rules concerning the flying of machines within a certain distance of another aviator.

As an indication of the interest that the United States War Department is taking in the encouragement of aviation, it may be cited that the plans for increasing the present equipment contemplate the following:

1—Five conveniently located training schools to be known as centres of aviation, to be located, one on the Atlantic Coast, one on the Pacific Coast, one on the Great Lakes, one on the Gulf Coast, one at some central point, and as many auxiliary centres as it may be possible to organize, with a view to having a school of instruction in each state. Each centre will comprise sheds, workshops, storerooms and barracks, and will be both a place of instruction and a place of concentration for the squadrons. These centres of aviation are designed to train officers of the regular army and organized militia as aviators, to train enlisted men as aeroplane mechanics, to investigate and test aviation devices, to study meteorology as applied to aviation, wireless telegraphy as applied to aviation, military topography, sketching and reconnoissance from air craft, the dropping of projectiles from air craft, the use of small arms and machine guns from air craft, the design of military air craft, and all other matters tending to improve the military aviation service.

2—The organization of three aviation squadrons as the complement for one field army of regular troops, this being an allowance of one squadron for each division and one for the headquarters of the field army. It is expected to specialize for each field army a company or squadron of extra powerful machines for long distance reconnoissance and to also specialize a number of machines for use in connection with the field artillery.

3—The organization of two squadrons for use in the Philippine Islands.

4—The organization of one squadron for use in Hawaii.

5—The organization of one squadron for use in Panama.

6—The organization of aero units for use at 14 groups of coast-defense stations in the United States, the equipment for these 14 stations not to be less than the equivalent of eight squadrons.

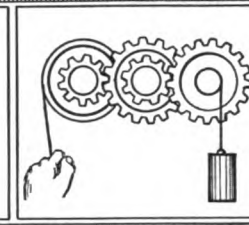
7—(Organized militia)—All mobile troops in addition to one field army to be provided with aviation service from the organized militia, with the assistance of the staff of the five training schools (aviation centres); the allowance of aeroplanes to be in the same proportion as for the regular establishment—i. e., one squadron for each division of troops.

Italian residents of Philadelphia have contributed a fund with which to purchase an aeroplane as a Christmas gift to King Victor Emmanuel III. of Italy.

It appears that the "All-British" machine with which H. G. Hawker of England took the British Michelin cup No. 1 for duration during 1912, was in fact a Burgess-Wright biplane, made by the Burgess Co. & Curtis at Marblehead, Mass. This statement is based upon no less authority than Flight, a British aerial publication, although it states as its belief that nothing of the original aeroplane purchased by T. O. M. Sopwith of the Massachusetts constructor remained at the time of the winning flight, since it had been completely rebuilt in the Sopwith plant. It was entered as a Sopwith-Wright biplane.

The original biplane was built by the Burgess concern expressly for Sopwith when he was in this country in 1911. After returning to England the Wright form of control was replaced by an Henri Farman device, and a revolving Gnome engine was installed. Previous to the flight in question this motor gave way to a British A. B. C. The other equipment was: Carburetor, Zenith; magneto, Bosch; plugs, Bosch; propeller, Bristol; fabric, Spencer. All these items were of British manufacture.

Mlle. L. Galanschikoff of Russia created a new world's altitude record for women pilots at Johannisthal, Germany, Nov. 22, driving a 100 horsepower Fokker two-passenger monoplane to an altitude of 7875 feet. The previous record for women was 3133 feet, held by Miss Meily Bleese.



The Maurice Farman biplane, fitted with an eight-cylinder Renault engine again holds the duration and distance records, according to recent information from France. It appears that M. Fourny flew one of these machines over the Etampes aerodrome for 13:17:57.2, covering a distance of 628 miles without alighting. The flight was made in competition for a prize offered by the Aero Club de France under conditions reviving those which formerly governed the award of the Michelin cup.

Fourny began his flight at 6 in the morning and was still rounding the five-mile course when darkness settled. He carried 110 gallons of gasoline and remained at an average of 100 feet from the earth. At 4 in the afternoon he had exceeded the mark for distance held at 460 miles by Gobe in a Nieuport monoplane. When the sun disappeared empty gasoline barrels were made into a bonfire to enable him to define the outlines of the aerodrome. He landed at 7:15 in the evening, having exceeded the duration mark of 11:01:29.2, held by himself.

The Society of Motor Manufacturers and Traders of Great Britain and the Royal Aero Club have decided upon Feb. 14-22 as the dates for the international aero show which will be held at Olympia, London. Full particulars as to the exhibition of machines may be had by addressing the secretary of the Royal Aero Club, 166, Piccadilly, London, W.

RECENT MOTOR VEHICLE PATENTS

Anklam Lamp.

William F. Anklam, Detroit, assignor to the C. M. Hall Lamp Company of that city, has been granted a patent for an electric lamp having an adjustable parabola mirror. The conventional practise is to secure the desired focus of the light by moving the bulb, but in the Anklam device the reflector member is slid backward or forward as the case may be. A post extends from the lamp casing and is provided with a socket for securing the bulb. The reflector is sleeved upon the post and also has a bearing in the cylindrical flange at the outer end of the reflector. A screw adjustment is incorporated, of a thread and nut type, and means are also provided for securely locking the lamp against the entrance of foreign elements.

Hallgren Valve Lifter.

A valve lifting device, in which means are incorporated for locking when desired, has been patented by Bror Cal Ivar Hallgren, Pasadena, Cal. It comprises a pair of levers pivotally connected, and a segmental bar similarly mounted on one of the levers and having a series of recesses. The other lever has a slot through which the segmental bar extends, and a locking pin is pivotally secured to the slotted member. It is adapted in one position of the pin to register with the slot in the lever so as to allow free movement of the segmental bar, and in another position, to enter the slot, engage with one of the recesses and to lock the levers. A handle is provided for locking the pin member. It is held by the inventor that the valve spring may be compressed and the tool locked, permitting the use of the hands in extracting the cotter pin or in working upon the valve mechanism.

Peck Carburetor Device.

Elbert C. Peck, San Bernandino, Cal., has been granted a patent for an air mixing attachment for a carburetor. It comprises a supply duct leading from the vaporizer, a throttle valve rod, a pipe for supplying air to the supply duct and a perforated distributor nozzle. The latter is located at one end of the pipe and is tapped into the supply duct. The other end of the supply duct has an opening therein, a sleeve rotatably mounted, also an opening adapted to register with that of the pipe member. An arm is secured to the throttle valve rod and a similar member on the sleeve, these arms being connected by a link.

Gold-Messinger Demountable Rim.

A patent for a demountable rim has been granted Edgar L. Gold and Jacob H. Messinger, Nazareth, Penn. It comprises a wheel having a demountable rim, the combination with the felloe, and a band around it, whose periphery is flat at one side and flaring at the other and provided with transverse notches. The rim comprises a flat band having an internal bevelled bead at one edge adapted to contact with the flaring portion of the band and a plain bead at the other edge, whose internal diameter is greater than the external diameter of the flat portion of the band. The fastening ring has an axially projecting fin adapted to pass between the plain bead and the flat portion of the band and is pierced with openings registering with the notches. Removable bolts engage the openings and the notches.

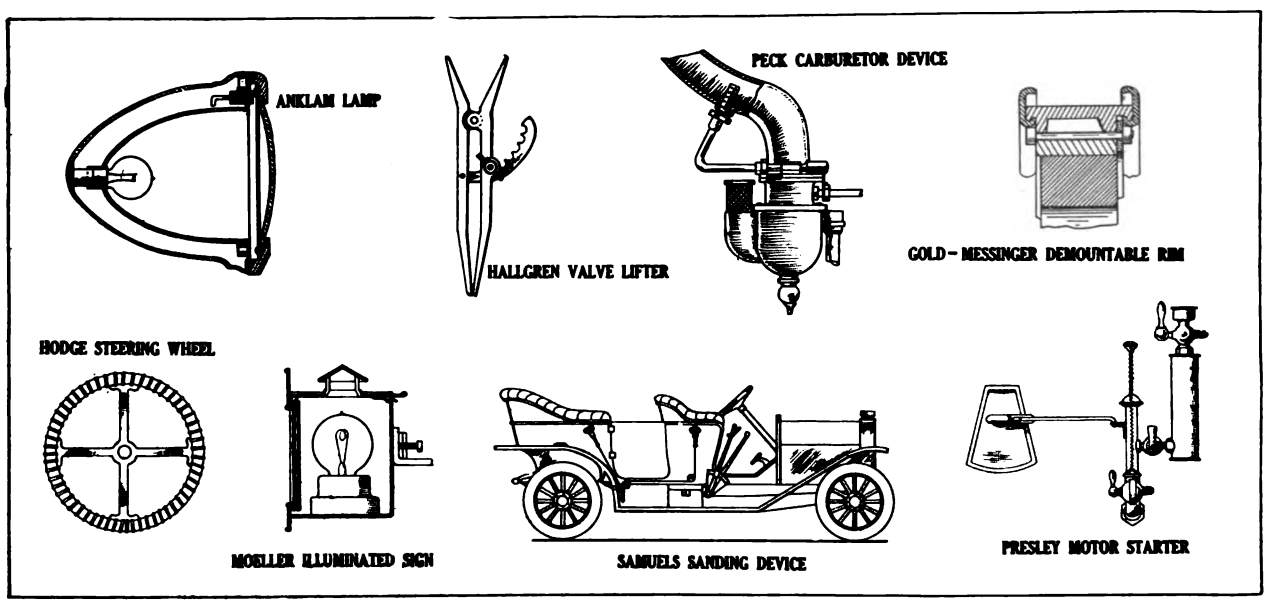
Hodge Steering Wheel.

There is a general tendency to employ corrugated steering wheels to provide a better grip. Fred L. Hodge, Middletown, Conn., has been granted a patent for a steering wheel which consists of the conventional web spokes and wooden rim around which are wound coils of wire. The wood is recessed to prevent slipping of the wire which is also passed through apertures in the spokes. Means are provided for locking the ends of the wire.

Moeller Illuminated Sign.

An illuminated sign for motor cars has been patented by Henry A. Moeller, Central Falls, R. I. An electric light is enclosed within a frame member which has an open front. The casing is provided with oppositely arranged perforations and a frame is permanently secured back of the open front of the casing. The latter is also provided with an opening at the top. A transparent

Digitized by Google



sign plate is located within the frame and is fitted with a removable member which secures the plate in position and has pintles which enter the perforations of the casing.

Samuels Sanding Device.

Various methods are employed for preventing the skidding of the car on wet roads, including tire chains and anti-skid shoes, but a novelty is presented in the patent of Lester W. Samuels, New York City, which covers a sanding device for automobiles. The right hand rear fender is constructed hollow and serves as a container for the sand. The lower extremity of the guard is provided with a spout having a valve which is manually controlled. Handles are located convenient to the driver and the occupant of the right hand rear seat, being actuated by a pull rope which opens the valve member, allowing a stream of sand to flow upon the tread of the shoe, providing traction.

Presley Motor Starter.

William J. Presley, Grand Haven, Mich., has patented a motor starter for internal combustion engines. The principle involved is that of priming the cylinders with a combustible fluid when the ignition is cut off and the motor stopped. A reservoir is provided for containing a volatile fluid, such as sulphuric ether, and the top of the container is fitted with a filler member resembling in construction a priming cup. A pump is connected to the reservoir and means are provided for conveying the fluid to the intake pipe or manifold of the engine, as well as a valve for controlling the flow of the liquid. The pump has a projecting plunger rod, spring controlled, also a latch adapted to hold the rod in an outward position with the spring under tension. A rod member connects the pump with the ignition switch and when the plunger is operated, forcing a charge to the cylinders, the ignition is cut off.

Depicting Some of the More Recent Patents Applicable to the Motor Car, Including Valve Lifter, Carburetor Device, Steering Wheel, Sanding Apparatus and Motor Starter.

OTHER PATENTS GONE TO ISSUE.

Wheel Heater, Earl D. Shannon, Alpena, Mich. The steering wheel is hollow and contains a number of filaments heated by electricity. Means are provided for moving the heating members to concentrate the heat.

Vehicle Headlight, Herman C. Keininger, Pocahontas, Mo. The headlights are actuated by the steering mechanism of the car and move in conjunction with the front wheels.

Sparking Plug, Frederic William Erickson, New York City. The lower extremity of the shell is rounded and the electrode is ball shaped. An opening in the spherical member permits egress of the flame of the ignited mixture.

Electric Lamp Guard, Clarence H. Hunsberger, North Towanda, N. Y. A wire guard for electric lamps designed to be moved. Means are provided for locking the bulbs into position and for removing same when desired.

Carburetor, Charles M. Stroud, Minneapolis, Minn. The carburetor differs from those of conventional practise in that the level of the float chamber is but slightly above the bottom of the mixing chamber. The overflow of the fuel forms a shallow pool for starting purposes.

Igniting Device, Asmus Philippsen, Bridgeport, Conn. A device for igniting acetylene lamps. Sparks are created by a ratchet wheel device contacting with a sparking material.

Cushion Tire, Harrison A. Fry and Guy J. Bruce, Spring Lake, Wis. The interior of the tire is fitted with a holder member in which are located a number of looped springs.

Jack, Le Roy Willour, Ashland, O. The stub shaft is provided with a rotatably mounted wheel having a number of teeth and the operating crank is constructed to engage with the same. Means are provided for securing and reversing direction of the wheel member.

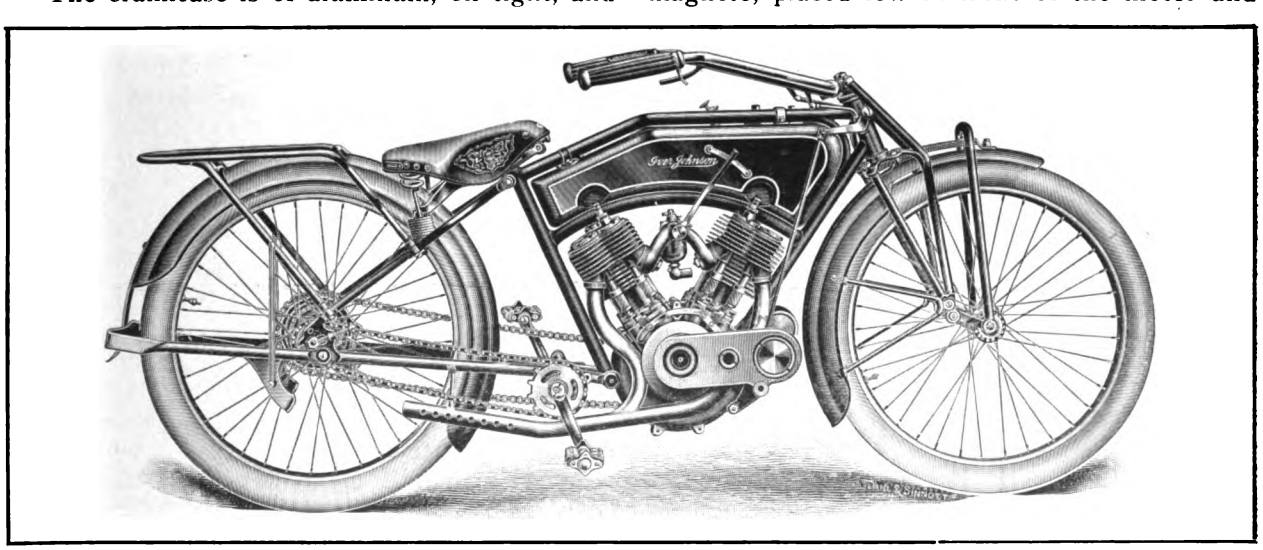
ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

New Iver Johnson Twin.



Early in the year the Iver Johnson's Arms & Cycle Works, Fitchburg, Mass., announced a new single-cylinder mount. This will be continued for the 1913 season, but the line has been increased by the addition of a twin. The single presents a number of refinements that a year of manufacturing has found desirable, but greater interest naturally will centre in the new model.

The Ivers Johnson twin motor is rated at 7-8 horsepower, having a bore of 3.25 inches and stroke of 3.75. The cylinder is cast with integral head from the finest quality gray iron, and is accurately bored and ground. It presents a very large cooling surface, air circulating completely around the valve chambers. All four valves are mechanically operated by one large cam which is driven by an internal gear. The valve stems are extra long and hardened on the lower end, with provision for oiling at this point, and are protected from burnt gases and carbon deposits by running in a long hardened outer sleeve.

The crankcase is of aluminum, oil tight, and the oil gauge glass is fitted to the plug so that the latter may be removed for washing out the case without disturbing the glass. The entire crank, including shaft and crankpin, consists of two parts. These halves are connected by the taper projection of the right side wedging into the hollow corresponding projection on the left, thus forming a solid crankpin. The taper projection has a double locked nut on the end. The flywheels are firmly riveted to the cranks and the latter are recessed to increase the length of the crankshaft and crankpin bearings. The shaft and pin are not hardened, but have steel sleeves pressed on.

A particular advantage is claimed in the use of two crankpins instead of one, and in the fact that the cylinders are slightly out of line, so that each takes all the oil from one flywheel. Lubrication is automatic throughout, with positive feed from hand operated pump and centrifugal feed to the crankpin.

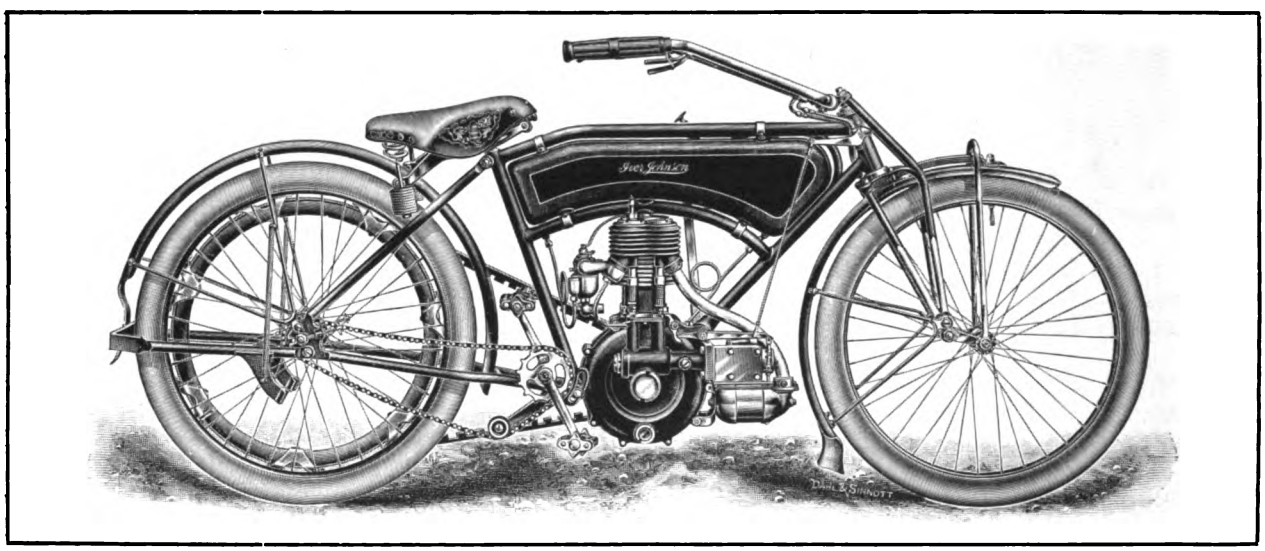
Ignition is by high-tension armored Bosch magneto, placed low in front of the motor and

The Iver Johnson Twin Mount Rated at 7-8 Horsepower—A Distinctly New Model.

Digitized by Google

driven by three gears on ball bearings in an oil tight case. The carburetor is a Schebler, with auxiliary air intake operated by a lever on the side of the tank. Control is by double grip, with steel telescoping rods and ball and socket joints. The tank is of pressed steel, copper plated inside and out. It holds 2.5 gallons of gasoline and two quarts of oil.

Transmission is by chain with undergear and free engine clutch. Both sprockets are large, eliminating wear and breakage. There is an arrangement in the undergear that permits the motor to be turned over by the feet at a speed one-third faster than that of the pedals, making for easy starting when the engine is cold.



The frame is a reinforced truss bridge, of 1.125-inch, 14 gauge seamless tubing, all connections being of vanadium steel, long and tapered to a thin edge and reinforced at the head. The fork has four-leaf vanadium steel springs, and is held to be very flexible. A solid rear fork is fitted unless otherwise specified, but a special spring construction is supplied as an extra.

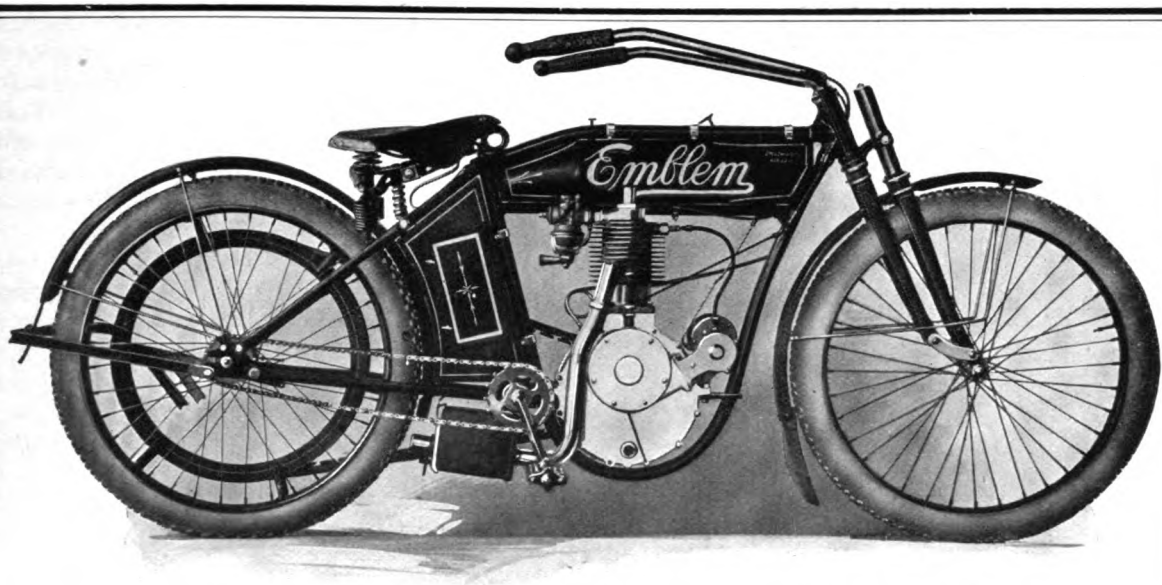
The guards are wide front and rear and of the deep pattern. The rear member is detachable. Wheels are 28-inch standard, with 40 steel spokes. Tires are 28 by 2.5-inch front and 28 by 2.75-inch rear, option of United States, Goodyear or Goodrich being offered. The saddle is either a Persons, Champion or a Standard Cavalry. A Corbin band brake is fitted.

The single-cylinder machine is constructed with the same attention to detail as that which marks the new twin, or perhaps it would be better to turn this statement about, since the single already has seen one season's service. The features are practically the same as last year.

In the motor which is rated at 4-5 horsepower and has the same bore and stroke as the twin, both valves are operated and the magneto is driven by one solid part—the camshaft. This is driven by a single spiral gear keyed to the end of the crankshaft. The camshaft, both cams and the gear are forged from a single bar of steel, and the shaft runs in heavy bronze bushings.

The clutch on the single-cylinder machine is another feature of which the company is particularly proud. It consists of a pulley running free on a roller bearing, two plates or cones, a coil spring, four arms, one ball retainer, a cap and a control button. The inside cone is keyed to the crankshaft and the outside member is held against the pulley by the heavy coil spring. The outside lever forces the button against this spring, thus releasing the cones. Between the cones and the pulley are fibre discs, and as the frictional surfaces between these two members are five times greater than between the pulley and belt, the pulley may be allowed to slip for slow speeds without burning the fibre. The transmission on this model is by V belt.

The Iver Johnson Single-Cylinder Motorcycle for 1913, Rated at 4-5 Horsepower.



New Thor Officials.

At the annual meeting of the stockholders of the Aurora Automatic Machinery Company, Chicago, maker of Thor motorcycles, John P. Hopkins, president of the concern and former mayor of Chicago, resigned and his place was taken by Simon Florsheim. John D. Hurley was elected vice president and F. W. Buchanan secretary.

ANGOLA ERIE COUNTY NEW YORK

Behrend, Eighth street and Eighth avenue, Huntington, W. Va., as state commissioner. Local commissioners have been appointed as follows: Hugh Scanlan, Bradley, S. D.; L. O. Redmond, Lindsay, Cal.; Tony Perry, San Pablo, Cal.; Howard Hunter, Walnut, Cal.

Four New Majestic Sidecars.

Owing to the steadily gaining popularity of motorcycle sidecars, the Majestic Manufacturing Company, Worcester, Mass., maker of the Majestic, has decided to continue the model of 1912 and add four new passenger sidecar models. A parcels delivery car will also be produced during the coming year.

Seeking Lower Freight Rates.

A hearing was held recently in the Customs House building, New York City, before Chairman Prouty of the Interstate Commerce Commission, to consider freight rating on motorcycles in the official classification territory, which comprises that section of the country east of the Mississippi river and north of the Ohio river. The formal complaint was filed by the Motorcycle Manufacturers' Association against the Baltimore & Ohio railroad, but the New York Central classification committee was virtually the defendant as eastern representative of all the railroads. A. L. Colyer appeared for the committee and endeavored to show why the rating on motorcycles was advanced in 1910 from second class to first class carload, and the minimum weight from 10,000 to 12,000 pounds.

The Motorcycle Manufacturers' Association was represented by its attorney, H. L. Freedman, and C. F. Duggan, traffic manager of the Hendee Manufacturing Company, Springfield, Mass. Mr. Duggan presented much pertinent testimony in the manufacturers' contention that the motorcycle rating should be reduced from first

to third class. He stated that the rate from Springfield, Mass., to San Francisco, Cal., is $4.50 a 100 pounds for less than a carload, and $4 a 100

Six Men on an Emblem Motorcycle.

pounds in carload lots. Under this rate he said it costs over twice as much to ship a motorcycle from Springfield to California as from Springfield to London, Eng.

Harleys Win in California.

At the recent motorcycle run from Bakersfield, Cal., to Delano, Cal., a distance of 62 miles, the interest was intense and first place was won by Harley-Davidson machines. A feature of the first race, a single-cylinder event, the finish of Taylor on a Harley-Davidson, was sensational in the extreme. The plucky rider's gasoline gave out before the finish, but he resolutely trundled his machine along Chester avenue in Bakersfield and pedalled it across the line, defeating Dupes by 1:15. The finish was at first questioned but the protest was disallowed. Taylor's time for the distance was 1:51:20. The other two starters did not finish. The second run, for heavy machines, resulted as follows: First, Lighter, Harley-Davidson, 1:40:00; second, Parks, Merkel, 1:44:30; third, Clark, Thor, 1:46:13; fourth, Berges, Thor, 1:46:50.

Six Men on an Emblem.

It always has been contended by the Emblem Manufacturing Company, Angola, N. Y., that the Emblem motorcycle was sturdily constructed. An accompanying illustration would appear to demonstrate that this is a fact. The machine in question experienced no difficulty in surmounting the grade with the six men shown in the picture.

Life Members in Chicago.

The Chicago Motorcycle Club, taking action similar to that of other large organizations, has decided to issue life membership tickets, to cost the members $50 each. At the first meeting, when the proposal was accepted, seven members took advantage of the offer, as follows: President R. R. Hill, F. E. Yates, Fred Huyck, Burley Ayres, William Walsh, Frank Nelson and C. H. Lang. Only a limited number will be issued.

Suggested F. A. M. Uniform.

A. B. Coffman and J. Leo Sauer, the committee of two appointed at the annual convention of the Federation of American Motorcyclists at Columbus, O., to report upon adopting an official uniform for F. A. M. riders, have submitted the details of their conclusions. Three different materials will be adopted, all of which shall be a dark olive color and the same in style. The summer uniforms will be made of either genuine Roseberry or material known as shelter tent. The winter suits will be made of fustian, similar to corduroy. The coats will be made Norfolk style and the F. A. M. emblem, in blue and gold, will be woven in silk and sewed on each side of the coat collar.

Yale Squadron Visits Merkel.

The Most Powerful Twin Made

Since our 1913 announcement appeared two weeks ago we have received two or three sacks of mail every day—all inquiries from persons who want to know more about

THE FLYING MERKEL

The Only Self-Starting Two-Speed Motorcycle in the World

The 1913 Flying Merkel embodies every feature that could be desired in a motorcycle, and many exclusive features hitherto believed impossible to apply to a two-wheeled vehicle. The wonderful Self-Starter, Two-Speed Free Engine Hub, Hess-Bright full Ball-Bearing Motor, the Original and **Only** successful Spring Frame, low saddle position, Mechanical Valves and many other features.

Exhaustive tests have proved the 1913 Flying Merkel the most powerful motor made. The twin has climbed hills that no other motorcycle ever before has conquered, while the single can romp up tortuous grades that some big twins have difficulty in surmounting.

The 1913 Flying Merkel universally has been acclaimed the sensation of the motorcycle world. Ask the most successful dealer in your town—he represents the Flying Merkel, or write direct to us for 1913 advance catalog.

Herz Motorcycle Magnetos.

Among the new features which will be displayed at the forthcoming shows will be the 1913 Herz motorcycle magnetos, made by Herz & Co., Lafayette and Houston streets, New York City. In designing these new types the company has taken into careful consideration all the peculiarities of the various makes of motors on the market, and has embodied certain constructional features which are expected to meet all requirements.

The Herz magneto is now constructed with double U shaped magnets carefully ground and fitted over each other. Their side plates also are carefully ground to secure a straight surface for the attachment of aluminum plates, making a

The Herz Motorcycle Magneto for 1913.

dust and water proof joint. On the inside of the magnets are attached two pole pieces, and the armature is so closely fitted as to leave a clearance of but .003 inch. At the top and bottom of the pole pieces are fastened metal plates which close up the pole housing and prevent dust and moisture from entering and getting between them and the armature.

The armature and condenser have been improved in a manner to prevent flashes at the platinum points, a construction held to prolong the life of these parts. The former runs on high grade ball bearings, so designed as to retain sufficient lubricant to last for an entire season. On the shaft end of the armature and in front of the secondary contact ring is fitted a deflector disc, the object being to throw off all oil or moisture entering from the gearcase to the wall of the bearing box, and a hole is provided in the base of the magneto for the purpose of draining off any water or oil that might accumulate at that point.

The platinum points of the contact breaker are of large dimensions, the old members being three mm (about .115 inch) diameter, whereas the new ones measure 3.5 mm (about .13 inch). The screw itself also is much larger, making for more strength in every way. To facilitate adjustment, the check nut holding the screw is extended further from the steel block, a recess being milled in the base just below the hexagon nut, to permit the free use of the wrench. There also is a gauge plate attached to the flat wrench for adjusting the points to secure the correct gap. In addition a socket wrench is supplied to fit the flat end of the platinum point screw. The sight hole drilled in the contact breaker base just behind the platinum points, for the purpose of examining the points to see if they are clean and are bearing properly, instead of being open as heretofore, is now closed and protected by a mica disc. The breaker boxes fit over a shoulder extending from the side plates, securing a perfect alignment of the armature and preventing binding against the pole pieces.

The single-cylinder magneto is provided with one long segment covering about two-thirds of the inside circle of the segment box, keeping the contact points open to overcome the second induction of the armature, thereby developing a strong spark. These points are interrupted once only during each revolution, instead of twice as in the old type.

In designing this type the company not only is offering an apparatus of light weight, but one that can be attached easily to all motors where space is limited. The same features of enclosed, dust and water proof construction are provided as in the magneto already described, and it is maintained by the maker that it is of very high efficiency, developing great power and high speed, and giving a very strong spark that will start any motor readily.

Motorcycles for Parcels Post.

The postoffice at Springfield, Mass., has made arrangements with the Hendee Manufacturing Company of that city to provide several Indian motorcycle vans for the delivery of parcels after the parcels post law goes into effect Jan. 1. The compartments of the van will be arranged in shelves, similar to those used by department

Digitized by Google

stores, which will facilitate the quick handling of the mail according to the route to be covered. Another van, somewhat similar in type, has been contracted for to collect mail between 9 and 12 at night. The compartment will consist of an inclined door so that on arrival at the postoffice the mail will slide out into a basket automatically.

New Merkel Distributors.

The Miami Cycle & Manufacturing Company, Middletown, O., maker of Merkel motorcycles, has closed a contract for the coming year with the Dominion Cycle Company of Winnipeg, Can., which has ordered an initial carload of the machines. The Western Cycle & Motor Company of Regina, Saskatchewan, Can., has also renewed its contract for another year. Walter Andrews of Toronto, Can., is a new acquisition and he will distribute the Merkel exclusively throughout the province of Ontario.

Another important deal has been concluded by Sales Manager Ash, who closed a contract with the Haverford Cycle Company of Philadelphia, whereby this company will distribute Merkels in the state of Michigan and will open a branch at Detroit. The F. B. Widmayer Company will distribute in New York City and surrounding counties, while John Pflieger will look after Brooklyn and Long Island. C. D. Feiler will represent the Merkel in Philadelphia and the Edwards Cycle Company of Minneapolis will take care of Minnesota and North Dakota.

Other Merkel agencies closed recently follow: E. L. Lawson, Auburn, N. Y.; Allen Pearson, Morrison, Ill.; Lake Bear, Anita, Ia.; E. T. DeGraff, Amsterdam, N. Y.; J. M. Boyne, New Haven, Conn.; Waterbury Cycle Works, Waterbury, Conn.; A. L. Johnson, Rockford, Ill.; G. R. Snyder, South Bend, Ind.; E. C. Robertson, Manhattan, Kan.; G. W. Jocelyn, Holyoke, Mass.; M. Madsen, Perth Amboy, N. J.; Ralph N. Leonard, Somerville, N. J.; F. S. Bump Company, Binghamton, N. Y.; C. Fred Danielson, Jamestown, N. Y.; E. F. Dheil, Huntington, Ind.; George E. Seavey, Haverhill, Mass.; Olive Cycle & Motor Company, St. Louis, Mo.; M. E. Lynde, Seneca Falls, N. Y.; L. F. Burke, Schenectady, N. Y.; Henry Hornberger, Springfield, O.; A. O. Lemon, Youngstown, O.; Harry F. Seamark, Washington, D. C.; Hays & Balmer, Clinton, Ind.; Reinhard Bros., Terre Haute, Ind.; J. W. Newton, Fall River, Mass.; John G. Ledyard, Camden, N. J.; Bush & McDougall, Newark, N. J.; Howard Cycle Company, Trenton, N. J.; Sorenson Company, Peekskill, N. Y.; Neff & Malone, Rochester, N. Y.

Indian Line for 1913.

Perhaps no single feature will attract more general attention or create more interesting comment in connection with the announcement of the Hendee Manufacturing Company, Springfield, Mass., than the spring frame on the 1913 Indian. The line will comprise four models, two singles and two twins. One of each type is listed as regular and the other as Tourist Trophy. The motors are identical in every respect, the singles being rated at four horsepower and the twins at seven.

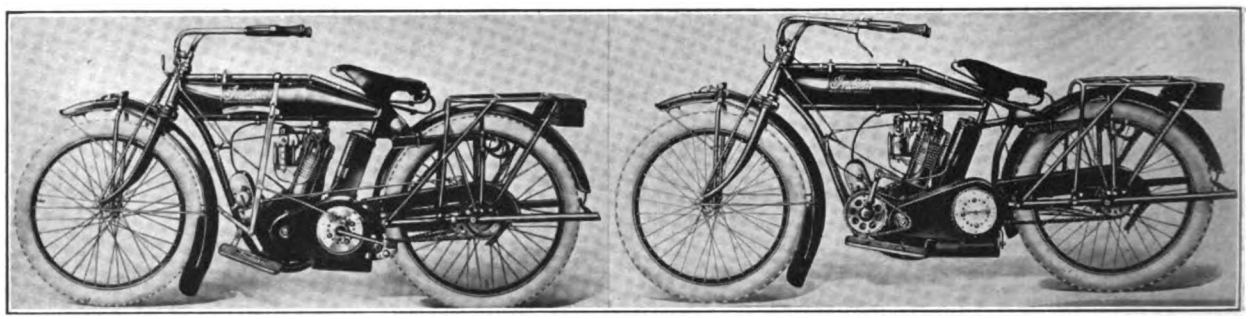
As is more or less well known, the Hendee factory has been increased by the addition of another building. The plant now covers 7.5 acres of floor space and comprises four buildings, each equipped with the most modern machinery, some of which is the company's own special design. It is estimated that when in full operation the capacity of the plant will be a complete Indian motorcycle every three minutes of the working day.

It may be stated that the new cradle spring frame has been tested under severe conditions for the past 18 months, and is regarded by the engineering department as thoroughly serviceable in every respect. Briefly, it is the application to the rear of the machine the principle which has proved successful during the past three years in connection with the front fork. Extending back horizontally from the frame joint cluster below the saddle and flanking the rear mudguard are two seven-leaf chrome vanadium steel springs. The C shaped curls at the rear end of these are connected by stays to bell cranks on which the

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

B. A. SWENSON 298 Blackstone St., Cor. Prairie Ave., Providence, R.I.



1913 F. N. SHAFT-DRIVE MOTORCYCLES.

Lightweight Single, with Two-Speed Gear $275
Only Machine Built With Handle Bar Control of Clutch.
Four-Cylinder $300
With Handle Bar Control of Clutch $350
Two-Speed Gear, Extra $50
Equipment includes two brakes, footrests if desired, compound spring fork, combined luggage carrier and stand.

American F. N. Company, Boston, Mass.

Branch—415 Trumbull St., Hartford, Ct.

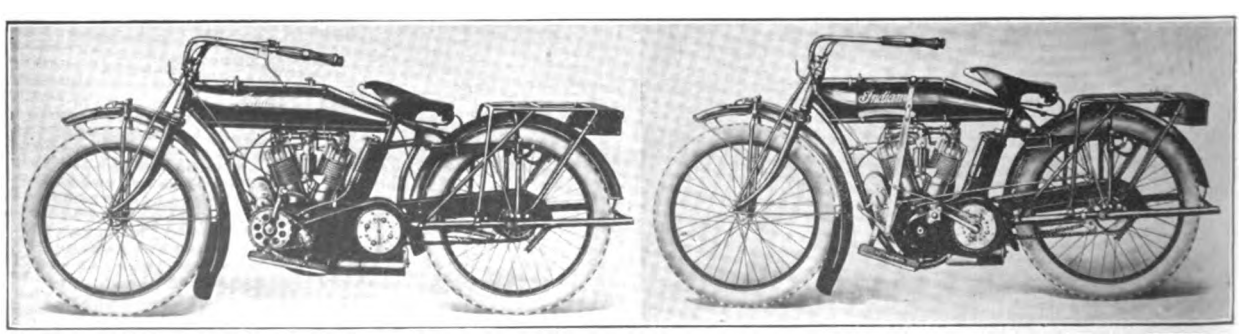
Indian Singles for 1913 Season: At Left, the Regular Model; at Right, the Tourist Trophy Two-Speed.

rear axle is hung. The forward end of the rear fork has a large joint which enables the wheel to yield to imperfections of the road surface. All shocks are held to be absorbed completely by the leaf springs, and the rear wheel is expected to be able to go through almost any vertical motion without affecting the body of the machine.



The motor has bore of 3.25 inches and stroke of 3.67, giving a piston displacement of 30.5 inches in the single and 61 with the twin. The principal improvement is to be found in that the connecting rod lower ends now run on roller bearings. There are three cages, each carrying 11 rollers, those in the outer cages being .75 inch long by .25 inch wide, and in the centre .375 by .75 inch. Forged steel flywheels are employed, and each wheel is one pound heavier than heretofore. The left main bearing of the motor is .25 inch longer. On the T. T. models the rear anchor plate is secured to the frame by two bolts instead of one. No cut-out will be fitted to any Indian during 1913.

Special attention is called to the main starter group, the pawls and ratchet of which are wider, making for increased gripping surface and decreased strain on the mechanism. The pedal crank axle also is longer and a heavier starter crank is employed. The pedal pin is hinged to fold inward when not in use, so as to give a free footboard, this original T. T. feature now being standard equipment upon all Indian models.

The two-speed gearset has been inverted, affording easier chain adjustment and better lubrication of the gears, the countershaft running in an oil bath, which is splashed to the line shaft gears and all bearings. By the reversal of the gearset suspension it follows that the sequence of the speed indices on the quadrant likewise is transposed, "high" now being in the forward notch and "low" in the rear.

All singles now carry the large clutch fitted to the 1912 twins. On the T. T. machines the left pedal control has been substituted for the hand lever used heretofore. The pedal is double acting and remains set in any position. On the regular models the lever is retained and a friction plate on the sector holds the clutch in any fixed position desired. The small countershaft sprocket is now locked with dogs, similar to the rear hub sprocket, producing what is regarded as a more rigid and secure fastening.

Double and independent brake control is now provided on regular models. The auxiliary control of the Corbin coaster band brake is a pedal mounted just forward of the left footboard. A friction lock holds the pedals stationary when the feet are removed. Increased leverage is provided for the service member on the T. T. models. The telescoping tube containing the brake cable tension spring now is mounted hori-

Indian Twins for 1913 Season: At Left, the Tourist Trophy Two-Speed; at Right, the Regular Model.

Digitized by Google

zontally on the lower right fork, giving direct brake pull and decreasing sticking proclivities. The T. T. emergency brake pedal now has an external return stop and spring conveniently located.

All 1913 Indians will be chain driven. The upper length of the long chain is shielded by a guard which extends around the rear sprocket, also protecting it and the brake from mud and water. The rear wheel may be removed without disturbing this shield. The rims are stronger and lighter than heretofore and will take 28 by 2.75-inch or 28 by three-inch motorcycle tires. The former are fitted as standard, these being of the United States make. The fenders also are wider and heavier with ample clearance for chains on three-inch tires.

The combination tanks have a gasoline capacity of 2.5 gallons and an oil capacity of two quarts. These taper off at the rear to present a stream line effect, and it will be noted that the design for the T. T. models is slightly changed from previous practise. The saddle is a new Indian-Messinger type with semi-elliptic springs, having two sets of six leaves each. Complete equipment includes leather tool box, 10 by 15 inches, containing flat, open end wrenches, box clip, large oil can and giant hand pump, and a luggage carrier, but no tandem attachment.

Club Notes, Here and There.

The Atlantic City Motorcycle Club, Atlantic City, N. J., recently held a successful run to Tuckerville, in which about 20 riders participated. The prize winers were Edward Willis, William Specht, Henry Twader, Fred Risley and Walter Compton.

The election of officers for 1913 by the Los Angeles Motorcycle Club resulted as follows: President, R. D. Bessett; vice president, W. D. Price; recording secretary, A. H. McCulloh; financial secretary, F. L. Johnson; treasurer, William Devenia; sergeant-at-arms, Charles Reginald Wride; captain, Claire Smallcomb.

The yearly election of officers of the Bay Ridge Motorcycle Club, Brooklyn, N. Y., was held recently, after which a turkey supper was served. The results follow: President, H. Bishop; vice president, L. Goemans; treasurer, Jules Verbeck; secretary, J. MacCormack; captain, W. Kaiser; first lieutenant, W. Moers; second lieutenant, John Verbeck; pennant bearer, C. Bergen; chairman of house committee, F. Deckelmann.

Henry Knapp, who organized the Kansas City Yale Club 11 years ago, is organizing a similar club at Omaha, Neb., with a women's auxiliary, a motorcycle department and bicycle division. The season will start next spring with a big parade of all the riders in the city.

VISO SPARK PLUG.

Provision Is Made for Noting the Condition of the Points at All Times.

When a cylinder misses the usual practise is to remove and test the plug. This involves disconnecting the wiring, etc. The Rapp Manufacturing Company, Toledo, O., is marketing a plug known as the Viso. Among the features of the plug is a window through which the action of the spark may be seen. If a flame is noted at the gap and ignition fails, it indicates that the points of the plug are fouled. The gap is adjustable by setting a nut which permits of increasing the space for the high-tension current to jump. This is held to intensify the spark and break down all oil or carbon between the points.

Viso Spark Plug.

Announcement is made by the company to the effect that it will move into new and larger quarters this month. The new building will provide 2000 square feet of floor space, which will permit doubling the present output. The company has been in business but four months. The officers of the growing concern are: President, H. A. Nummell; vice president, J. R. Schackne; secretary, C. D. Few; treasurer, Clifford Stone.

The Cole Motor Car Company, Indianapolis, maker of the Cole series 8, is issuing a technical bulletin and information book which is unusually interesting, in that the construction, operation, care and maintenance of the machine is explained in a non-technical manner. The different components of the chassis are illustrated and each member is lettered, making it a simple matter to follow the description of the part. Practical instructions for making adjustments are also given as well as driving suggestions. The book is by Charles S. Crawford, chief engineer.

The following concerns have been recently incorporated to deal in motor cars, accessories, etc.:

Eastern Motor Car Company, Los Angeles, Cal.; $25,000; incorporators, G. R. Jones, C. Greenberg, A. Murphy.

Usher Automobile Stop Company, Chicopee, Mass.; $15,000; incorporators, Frank H. Page, Frank D. Howard.

Broadway Garage Company, Barnesville, Minn.; $4000; incorporators, George J. Dahm, John A. Cramer.

Flex-O-Fill Core Company, New York City; $50,000; to deal in compound for filling tires; incorporators, Mark A. Noble and others.

Knight Motor Car Company, San Antonio, Tex.; $10,000; incorporators, H. L. Knight, A. H. Danforth, A. H. Elmore.

Northern Ohio Motor Company, Cleveland, O., $25,000; dealing in automobiles; incorporators, Herbert W. Bell, E. L. Bennings, F. C. Anselm, E. P. Eirich, C. L. Guthrie.

Slattery Bros. Automobile Company, Worcester, Mass.; $10,000; incorporators, William J. Slattery, John McCoy Slattery, Mary J. McCoy.

Lakeside Motor Truck Transportation Company, Chicago; $25,000; motor transportation; incorporators, B. P. Dunlap, J. M. Dunlap, E. W. MacAvoy.

Storm Shield Manufacturing Company, Chicago, $100,000; to manufacture automobile accessories; incorporators, L. E. Street, R. E. Wighton, N. P. Street.

Joseph U. Bender, Inc., New York City.; $10,000; to deal in automobiles, etc.; incorporators, Elizabeth Bender and others.

American Commer Truck, Inc., New York City; $10,000; to manufacture motor trucks, machinery, etc.; incorporators, Raymond C. Thompson, Julius Kahan, Edward C. O. Thompson.

Kells Motor Radiator Corporation, New York City; $650,000; to manufacture and deal in motor radiators; incorporators, Henry R. Bingham, Alexander F. Carbe, Cornelius A. Cole.

Motor Mechanism Company, Cleveland, O., $25,000; to manufacture automobiles and automobile parts; incorporators, Edward Younger, Florence Castle, Herbert C. Evans, H. E. Gray, S. E. Sackerman.

Auto Mart Company, Cleveland, O.; $10,000; to deal in and let for hire, automobiles, motorcycles, etc.; incorporators, Edward C. Plietz, W. G. Radcliffe, William H. Haselman, M. R. Wallace, Louis C. Heinberger.

Rose City Auto Company, Newcastle, Ind.; $10,000; incorporators, Frank E. Smith, Charles W. Mouch, William F. Byrket, Howard M. Van Matre, Gordon Cameron, Lawrence W. Bailey, Albert D. Ogborn.

Hall-Miller Auto Company, Cleveland, O.; $5000; to deal in automobiles; incorporators, Joseph A. Freund, Jr.; A. H. Freund, L. D. Greenfield, Charles Kovanda, J. A. Freund.

WITH THE MANUFACTURERS.

Benjamin Briscoe, a director and secretary of the Automobile Board of Trade since its inception, has resigned, owing to his absence in Europe for several months, and the vacancies have been filled by electing John N. Willys of the Willys-Overland Company a director, and Roy D. Chapin of the Hudson Motor Car Company as secretary.

George H. Lloyd, formerly with the Velie Motor Vehicle Company, Moline, Ill., has joined the sales force of the American Motors Company, Indianapolis, Ind.

The Firestone Tire & Rubber Company, Akron, O., maker of Firestone tires and rims, has found it necessary to increase its production facilities. The photograph reproduced herewith was taken during a recent convention of salesmen at the home office of the company and not only shows the new factory building, but the addition which is now being erected.

N. H. Miniter, who for several years has been sales manager of the Stromberg Motor Devices Company, has resigned, and is now associated with the Findeisen & Kropf Manufacturing Company of Chicago, as factory sales manager. He will in future represent the Rayfield carburetor throughout the country.

The Adams Bros. Company, Findlay, O., maker of Adams trucks, recently delivered to the Kittanning fire department of Kittanning, Penn., a combination hose and ambulance wagon. The company also has an order from the city of Olean, N. Y., for chemical fire apparatus.

The Moon Motor Car Company, St. Louis, Mo., maker of Moon cars, has installed a large amount of new machinery in its rear axle department, this being made necessary by the increased demand for its product.

Orin S. Wilson, formerly manager of Studebaker branches at Denver, Col., and Des Moines, Ia., and a veteran in the Studebaker service, has been assigned to the East and South as district representative of the company's sales department. His headquarters will be at Broadway and 59th street, New York City.

The Ohio Motor Car Company, Cincinnati, O., has been purchased by a company headed by R. E. Northway as president. The name of the concern has been changed to that of Crescent Motor Company and the manufacture of trucks, light delivery wagons and pleasure cars will be continued.

The Page Auto Hoist Company, located in the plant of the Potato Sorter Company at Madison square, Grand Rapids, Mich., has acquired the site adjacent to the Michigan Hearse & Carriage Company and will build a large factory of brick and steel.

The Ford Motor Company, Detroit, maker of Ford cars, has decided to discontinue building a commercial car during the coming season and is now closing out the few machines of this type it has stored in stock.

Henry M. Duncan, formerly general manager of the Westchester Appliance Company, New York City, has been appointed supervisor of the eastern district of the United States Motor Company in place of W. F. Smith, resigned. He will have charge of the following selling companies: United Motor Atlanta Company, United Motor Syracuse Company, United Motor Washington Company, United Motor Pittsburg Company and the Keystone Automobile Company of Pittsburg. Mr. Duncan also will act as manager of the United Motor Philadelphia Company.

C. E. Reddig, chief engineer of the Columbia Motor Car Company, Hartford, Conn., and designer of the Columbia car, has resigned his position to become assistant chief engineer of the Timken-Detroit Axle Company, with headquarters at Detroit.

George R. Willman, sales manager of the Warren Motor Car Company, has resigned to become associated with the advertising department of the Studebaker Corporation, Detroit.

John H. Mowe, manager of the Detroit branch of the Firestone Tire & Rubber Company, has tendered his resignation, and Howard A. Coffin, formerly of the Warren Motor Car Company, will succeed him.

The Joseph Dixon Crucible Company, Jersey City, N. J., maker of the Dixon graphite lubricants, etc., announces that the selling price of its silica-graphite "one quality only" paint has been reduced. This is made

Digitized by Google

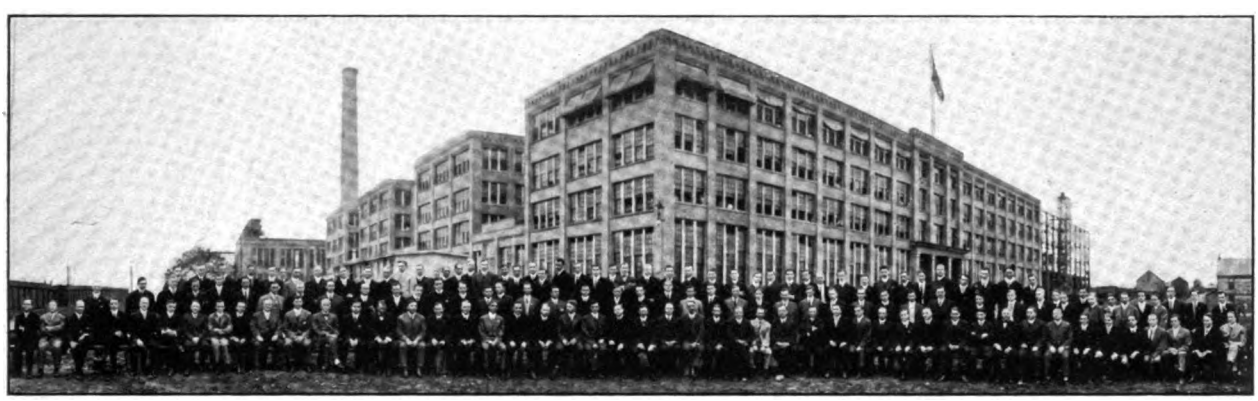
possible through a decrease in the price of linseed oil which is used as the vehicle. This well known paint has been recognized as standard for nearly 50 years with leading railroads and manufacturing plants, and as giving a long service protection to all exposed steel and metal surfaces. The announcement is in accordance with the firm's policy to give its customers any benefit possible in the reduction of price on materials.

The Bosch Magneto Company, New York City, has appointed the following distributors for Bosch magnetos: Dallas A. Shager & Co., Richmond, Va.; Fry & McGill Motor Supply Company, Denver, Col.; Johnson-Gewinner Company, Atlanta, Ga.; Pence Automobile Company, Minneapolis, Minn.

W. A. Buck, a Flanders factory representative, has joined the forces of the E. V. Stratton Company, Inc., Albany, N. Y., distributor for the entire Flanders line for eastern New York, western Massachusetts and Vermont. Mr. Buck is in charge of the Pittsfield branch at Pittsfield, Mass.

B. J. Cline, formerly factory superintendent of the American Motors Company, Indianapolis, Ind., has resigned and has taken a position as general superintendent of the Inter-State Automobile Company, Muncie, Ind., maker of Inter-State machines.

The Empire Automobile Company, Indianapolis, Ind., maker of Empire machines, has appointed the following distributors: Boonville Auto Company, Boonville, Ind.; Ye Motor Shop, Connersville, Ind.; Ralph Temple Automobile Company, Chicago; Wahl Motor Sales Company, Detroit; Jordan-Warneke Motor Car Company, Younger & Progmore, McMinnville, Ore.; Colonial Motor Car Company, Morgantown, W. Va.; H. S. Armstrong, Mt. Auburn, Ill.; H. Evans Sledge, New Bern, N. C.; Newton Motor Car Company, Newton, Ill.; Hearn Auto Company, Pine Bluff, Ark.; Augustus Duryea, Somerville, N. J.; Valentine King garage, Springfield, O.; Motor Truck Company, St. Paul, Minn.; L. Broadfoot and A. J. Manville, Prince Albert, Saskatchewan, Can.; W. L. Simpson, Punxsutawney, Penn.; H. A. Gordon, Regina, Can.; M. Streeter, Tacoma, Wash.; W. J. Hervey, Wellsburg, W. Va.; Corcoran & Foley, York, Neb.



GARAGE AND DEALER.

The Fiat Automobile Company, Chicago, has leased the three-story building at 2289 Michigan avenue, of H. G. and A. L. Howard.

A. L. Maddrell of the North Jackson street garage, Monroe, Wis., has sold his interest to the Hokoson Automobile Company of Madison, Wis., which took immediate possession. The company is capitalized at $100,000 and handles about 500 cars a year.

The Sawyer Auto Specialty Company, Columbus, O., formerly located at East Spring street, has moved to larger quarters at 50 East Long street. The company conducts a repair and manufacturing business.

The Somerville Automobile Company, Somerville, Mass., has changed its name to the F. A. Dutton Motor Company and is now located at 76 Huntington avenue, Boston, where it will have the distribution agency for Abbott-Detroit cars, made by the Abbott Motor Company,

Group of Firestone Tire Salesmen in Front of the New Factory Building at Akron, O., During Recent Convention.

Lewisburg, O.; Oakland Wisconsin Motor Company, Milwaukee, Wis.; Beauchamp & Horton, Mt. Carmel, Ill.; William F. Wagner, Massillon, O.; John R. Opp, Otterbein, Ind.; Williams-Hasley Motor Car Company, Pittsburg, Penn.; H. A. Reese, Severy, Kan.; H. K. Patterson, Timewell, Ill.; W. W. Campbell, Toronto, Can.; C. F. Erb, Youngstown, O.; C. J. Reeve, Cleveland, O.; John J. Gibson Company, Buffalo, N. Y.; Central Machine Works, Sioux City, Ia.; S. W. Schott & Co., Columbus, O.; Yappen & Son, Ashton, Ia.; Stirling Bros., Erie, Penn.; C. R. Baldrige, Braddock, Penn.; C. W. Sahlender, Belleville, Ill.; C. H. Reuber, Schaller, Ia.; Blewitt Auto Company, Ankeny, Ia.; Boone Auto Company, Boone, Ia.; F. B. Glidden Company, Corinth, Ia.; M. B. Pullen, Onawa, Ia.; Moreland Automobile Company, Earlham, Ia.; Bristow Automobile Company, Bristow, Ia.; J. M. Michelwait, Glenwood, Ia.; S. M. & E. R. Painter, Vandergrift, Penn.; Spooner McConnell Motor Car Company, Madison, Wis.; G. E. Eckert, Nevada, O.; Hank Bros., Ottona, O.

The Cole Motor Car Company, Indianapolis, Ind., has appointed distributors for the Cole cars as follows: Central Garage & Machine Shop, Calgary, Alberta, Can.; Boyle & Jaffe, Cheyenne, Wyo.; Columbia Automobile Company, Columbia, Mo.; Cole Sales Company, Dayton, O.; John H. Harris, Durham, N. C.; International Motor Company, Edmonton, Alberta, Can.; W. S. Fleming, Emerald, Wis.; W. T. Hutcheson, Hempstead, N. Y.; Dr. H. C. Miller, Hillside, Mich.; M. E. Reagan, Knightstown, Ind.; Joseph Simon, Lincoln, Neb.; E. M. Elder, Lynnfield, Mass.; Rowlette Auto Company, Maitland, Mo.; J. H. Edwards, Marks, Miss.; G. E. Bowden, Martin, Tenn.; Detroit. The company is capitalized for $25,000 and has the following officers: President, Frederick A. Dutton; treasurer, Charles A. Farnsworth; clerk, Jerome Smith. The old location in Somerville is being utilized as a service station.

The Standard Motor Car Company, Scranton, Penn., will erect an addition to its plant in Forest court, to cost $10,000.

Charles Benlen & Sons, 13th and Vineux streets, Cincinnati, O., is to establish a branch garage and storeroom on Rockdale avenue, to cost $10,000.

The Central Avenue garage, 934-936 Rose street, Reading, Penn., has been completed and is now ready for business. Harbster Bros. is the proprietor.

J. B. Garver of Terra Bella, Cal., is establishing a modern garage and auto hospital on Main street, in which he will sell and care for Studebaker cars, made by the Studebaker Corporation, Detroit.

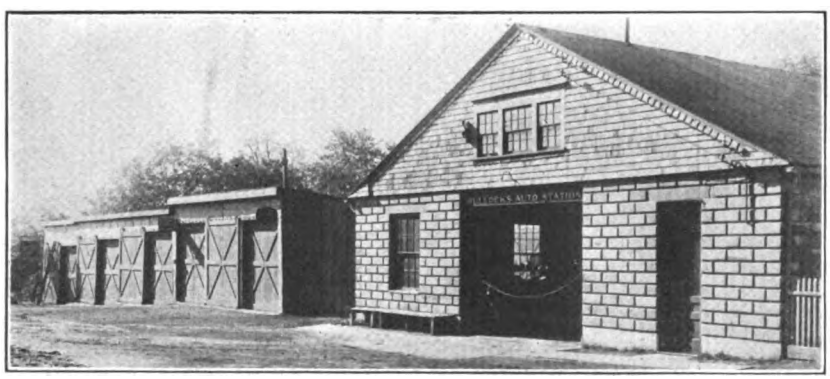
Martin's garage is the name of the old Coalinga garage, Coalinga, Cal., which will be reopened at once under the management of C. C. Kratzer. A complete line of automobile supplies, tires, etc., will be carried.

The Bennett Auto Supply Company, Sioux City, Ia., one of the largest sales organizations in the northwest, has occupied Motor Mart, said to be the largest building devoted exclusively to automobiles in that section of the country. The company has the agency for the Moon cars, made by the Moon Motor Car Company, St. Louis, Mo.

The B. F. Goodrich Company, Providence, R. I., distributor for Goodrich tires, has announced a joint organ-

Digitized by Google

ization with the Diamond depot, distributor for Diamond tires. The new combination will occupy spacious quarters at 260 Weybosset street, that city.



The Central Auto Company, West Sixth street, St. Paul, Minn., will in future handle the Premier cars, made by the Premier Motor Manufacturing Company, Indianapolis, Ind., in addition to its other lines.

Bullock's Auto Station, 9-19 Seekonk street, Providence, R. I., of which Richmond B. Bullock is proprietor, has been established about five years and during that time Mr. Bullock has built up an efficient organization. Although no specialty is made of repair work, minor work for patrons is done. The principal features of the business, however, are storage, washing and polishing, for which an efficient and simple system is employed to prevent leaks. The garage shown in an accompanying illustration has a capacity of housing 24 cars and contains in addition 13 private sheds for patrons. It is located in a residential section of the city.

D. S. Wyckoff & Son has secured a building on Third street, White, S. D., and will immediately convert it into a modern garage and repair shop.

A. V. Rothwell, Ann Arbor, Mich., has purchased the garage and business at the corner of South Ashley and Madison streets. This location will be the headquarters for Buick cars, made by the Buick Motor Company, Flint, Mich., and Federal trucks, made by Federal Motor Truck Company, Detroit, Mich.

The Hunter Motor Company, Roanoke, Va., will soon open its automobile salesrooms and garage in the new building at Henry street and Luck avenue.

Bullock's Auto Station, a Well Appointed Garage in Providence, R. I.

Edward T. Blair, Chicago, is having erected a new two-story garage at 1516 Lake Shore Drive, at a cost of $15,000.

Fred L. Harveycutter and Thornton Chesley have purchased the branch of the Kelly-Springfield Tire Company, Washington, D. C., and will conduct the business at the same location, 1730 14th street.

Edgar S. Harrington, proprietor of the Milford garage, will erect a modern garage on East Front street, South Milford, Del.

M. H. Taylor of Elmira, N. Y., has opened a new garage at the corner of Gray and State streets, to be known as Taylor's garage.

Fred Linzy of the firm of Linzy & Selover, Auburn, N. Y., and located in the Empire garage, has purchased the interest of his partner, Floyd Selover, and will control the business himself in future.

The Overland Auto Company, Phoenix, Ariz., has been formed to handle the Overland cars in that territory and an agency has been established at 329 North Central avenue. A. S. Earnhart is the manager.

The Santa Monica Auto Station, Santa Monica, Cal., is undergoing extensive repairs to prepare for an increased business.

J. J. Backus, chief building inspector of Los Angeles, Cal., has completed plans for the proposed municipal garage, machine shop and warehouse.

Bruce Champion, Osage, Ia., is the proprietor of a new garage and automobile repair shop in the William Champion building on Main street.

The George A. Schott garage on Acushnet avenue, New Bedford, Mass., has been purchased by Aldege Chaussee.

The Frank E. Parmelee Company, 132 Adams street, Chicago, will erect a one-story brick garage at 1117-1145 West Monroe street.

Pearl W. Devendorf, LaFargeville, N. Y., has taken over the Warner garage on Arsenal street, Watertown, N. Y.

Roy Worden and Jay Gould, Yuba City, Cal., have leased the Sutter garage of Frank Schellenger and will conduct it along broadened lines.

Alpheus Lane has sold his interest in the City garage, Paola, Kan., to J. W. Torrey of Kansas City.

Eric J. Gustafson has moved his garage from North Court street, Rockford, Ill., to the new Stewart building on Waterworks park.

P. F. Leeland and Hampton Mays have opened a modern garage and repair shop on East Conner street, Jacksonville, Fla.

The McKeesport Vulcanizing Company, McKeesport, Penn., of which S. L. Stitler and Harry Lebewitz are proprietors, has occupied a completely equipped plant at 214 Fourth avenue, for the vulcanizing and general repair of rubber tires.

The Canadian Motor Company, Winnipeg, Manitoba, Can., recently formed, has acquired the business recently carried on under the name of Ft. Rouge garage and also will control the City garage on Portage street and the new electric station on Carleton street. The company has the agencies for the Locomobile, Wolseley, Hudson, Cutting and Cameron cars. The capital is $500,000.

Frank Lyons and M. F. Jones of Sunnyside, Cal., have opened a first class garage and machine shop on the San Francisco road in that city.

The Lafayette Motor Car Company, Easton, Penn., has established new quarters at 233-235 North Third street.

The Queensboro garage at 66 Broadway, Flushing, N. Y., conducted by Jockers & Stack, is to be entirely remodelled. The company intends to start an automobile freight line and will begin operations with three large White trucks, made by the White Company, Cleveland, O.

The Co-Operative Tire & Supply Company, Cleveland, O., has opened a branch at Euclid avenue and East 20th street for the tires made by the Mansfield Tire & Rubber Company, Mansfield, O. The company will establish branches in various parts of the United States.

The Blasier-Sanborn Manufacturing Company, Utica, N. Y., with a capital stock of $150,000, has been formed to make and deal in steam and other pressure devices, machines and automobile supplies. George W. Sanborn of Little Falls, N. Y., is one of the promoters of the concern.

Ewald W. Lewer, Waseca, Minn., formerly in charge of the garage owned by W. J. Priebe, is having built a modern concrete garage to contain the most approved machinery for repair work. He will operate the establishment himself.

W. N. Eisenbradt is having a new garage built at a cost of $4000, to be located at 441 Drexel boulevard, Chicago.

George F. Fischer is having extensions made to his garage on South 11th street, Newark, N. J.

Fred Hulsebus, manager of the Shelby County Auto Company, Harland, Ia., has contracted for a large addition to be built to the garage of the concern.

B. H. Coleman of Warren Center, Penn., has purchased the interest of J. T. Corbin in the garage known as the Athens Motor Company, Athens, Penn. He will conduct the business on an enlarged scale and will make no change in the firm name. Lee Segar is connected with Mr. Coleman.

S. E. Drake, Lexington, Ky., has leased quarters at 234 East Main street and will carry in stock a full equipment of all models of Overland cars, made by the Willys-Overland Company, Toledo, O., and also a complete line of accessories.

The Swartz Automobile Company, St. Louis, Mo., which has the St. Louis territory for the Velie machines, made by the Velie Motor Vehicle Company, Moline, Ill., has moved to larger quarters at 5143 Delmar avenue.

EMPIRE AUTOMOBILE KNIFE.

Handy Combination Tool Which Would Make Ideal Christmas Gift for Motorists.

Chas. E. Miller, 97-103 Reade street, New York City, the pioneer automobile accessory house in America, may be depended upon to make the proper suggestion for a Christmas gift, or in fact any special need which may confront the motorist. With the 15 stores operated by this house in nine different states there never is any doubt about getting any accessory or fitting which may be desired. Miller's suggestion at this time is an Empire automobile knife.

This is a decidedly handy tool for the owner or chauffeur. More properly speaking, it is a combination of tools, comprising a pocket knife blade, screw driver, Prest-O-Lite tank key, etc. Chas. E. Miller's 256-page catalogue, which is free upon request, not only lists a great number of accessories, parts and fittings, but contains a large amount of valuable information for the motorist.

BOYER SUSPENSION BEARINGS.

Product of Sandusky Concern Embodies New and Interesting Constructional Features.

A new anti-friction bearing, for which many advantages are claimed, is being marketed by the Suspension Roller Bearing Company, Sandusky, O. It is made both in roller and ball types under the name of Boyer suspension bearing, and the company calls particular attention to the latter, stating that by the suspension system all of the balls are actual load carriers at all times, preventing possible crushing of them.

This is based on the claim that the load is not supported by the balls in one direction at right angles to the load pressure line, but at an acute angle. It is held that the load falls on the side of the ball and not on top or centre. In other words, in supporting the load, the balls rotate with an inclined axis.

The maker points out that the suspension principle logically withstands both radial and thrust pressures, while by distributing the load to all balls, the strain on each member is lessened by about 500 per cent. To effect this movement, the balls are placed between two similar raceways instead of having the customary raceway encircling them, with a companion raceway inside the circle of balls or rollers.

It is stated that the grit nuisance is obviated by the action of the balls, their movement tending to work foreign substances out between the raceways, instead of retaining them along the line of travel of the balls. A quality emphasized of the bearings is that only sufficient lubrication to prevent rusting is necessary. The bearings are made in different sizes for motor car construction, also for line and countershaft hangers and in various other forms.

SELF-VULCANIZING PATCHES.

Security Company's Product Held to Facilitate Repairs to Inner Tubes.

The Security Company, 14 Shingiss street, Pittsburg, Penn., is marketing the Security self-vulcanizing patches which make it possible to repair punctured or blown-out inner tubes without any equipment other than a little gasoline for cleaning the tube.

The patches are prepared with a self-vulcanizing coating over which is placed a protective cover. When a patch is to be employed the tube is cleaned with gasoline, the cover to the patch displaced and the self-vulcanizing surface moistened with a little of the fuel. The patch is then applied in the usual manner and the company states that the best test of sticking qualities is to try to remove it after a few miles of service.

The patches are made of red Para rubber, molded to a feather edge and coated as stated. Each cover is provided with an improved ear member for making easy the work of removal. The patches come in sets of 15, in a screw top box, and are inexpensive.

The company also manufactures patches for motorcycles and these are put up in a strong, indestructible rope paper, string fastening envelopes, making for convenience in storing on the machine. Full information will be forwarded upon request.

The Automobile Dealers' Association of Washington, Inc., was recently organized at Washington, D. C. The organization will conduct the automobile show which is to be held in Convention Hall Feb. 3-8, and has complete charge of the arrangements now going forward. The stockholders have elected the following officers: President, T. O. Probey; vice president, Charles W. Semmesl; secretary, E. A. Garlock; treasurer, F. C. Sibbald; board of directors, Arthur Foraker, J. H. Miller, I. J. Henderson, J. H. Earle and R. B. Emerson.

NOVEL CONTEST PLANNED.

Long Island Automobile Club Will Hold Modified "Top Gear" Run.

One of the competitions the Long Island Automobile Club will hold next year will be a sort of modified "top gear" run. In order to show throttling down qualities the prize is offered for the longest time taken to drive from the Prospect Park Plaza to Coney Island and return by the shortest way. The contest will be for members of the Long Island club only.

Each car is to be in high speed for a rolling start, which is allowed in order to avert stalling. The clutch must not be allowed to slip at any time when crossing or after having crossed the starting line with two exceptions. One is on the hill in Prospect Park, where the motorist must go back to first speed to ascend the first grade only. The other is that the change speed lever may be touched when it is absolutely necessary to alter speeds to avoid accidents. The motor must be kept running continuously throughout the competiton and the use of starting devices of all sorts is barred. This will not operate to keep out cars so equipped because each machine will carry one observer, whose duty it will be to see that this rule and others in the competition shall not be violated.

Correction of Error—In the Oct. 10th issue of The Automobile Journal Bray's Roni burner was described as being so constructed that should it become clogged the flame would shoot sideways. This should have read as follows: "If by any chance it should become stopped up, the flame will shoot in an upward direction, not sideways. The burner has but one gas way or orifice which is atmospheric, the air slot in the tip diluting the crude acetylene and destroying carbon."

WEED CHAINS
PREVENT ACCIDENTS LIKE THIS

What an awful game of chance we sometimes play on the checkerboard of Life!
How narrow is Life's victory over Death at times!
What a contrast is here presented! What an object lesson this scene portrays!

Absolute control and **perfect safety** on the one hand; on the other an "unruly balky" machine, whose seemingly greatest ambition was to bring its occupants face to face with disaster.

Picture for yourself the story:

Two cars traveling the same country road—a rainstorm overtakes them. Reaching a treacherous, slippery curve—

ONE CAR with scarcely any noticeable slackening of speed rounds the curve and **passes on in perfect safety.**

THE OTHER at the critical moment, **skids,** and in a flash, plants itself in front of the onrushing trolley.

A mass of wreckage, "nerve-shattered" passengers and a lasting memory of what might have been if the trolley car had not been stopped.

One Car was skid-proofed with Weed anti-skid Chains. **The Other** was not. Take the lesson home.

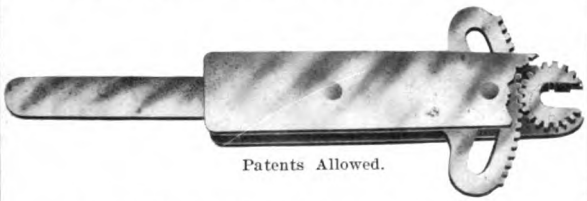
Weed Chains

Absolutely Prevent Skidding

Are you still taking your life in your hands by refusing to take the necessary precaution against the dangers of skidding? Are you still unwisely depending on "rubber alone" for the safety of yourself, the occupants of your car and other road users?

Weed Chain Tire Grip Co., 28 Moore Street, New York City

Make safety yours—take no chances. Fully equip your own car with Weed Chains today and **insist,** for your own protection, that other drivers do the same.



Weed Chains cannot injure tires because "they creep;" are put on in a minute without the use of a jack or other tools. Use them on all four tires.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. TRY THEM NOW.

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, litbographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

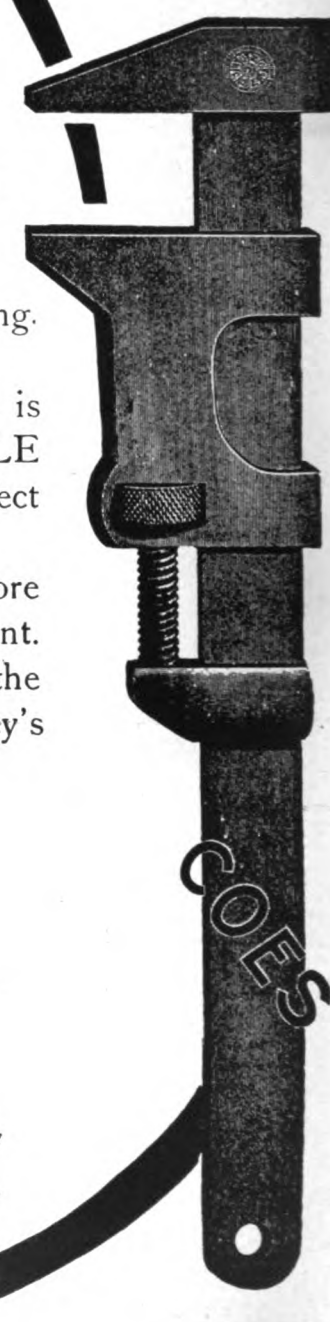
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

Send for Literature Now.

BOSCH
Magneto and Plugs

The Car Owner Who Avoids Trouble

is the owner of a Bosch-equipped car; he not only obtains maximum engine efficiency but reduces maintenance cost considerably—thus he is satisfied.

Manufacturers emphasize "Bosch" in their specifications, due to their knowledge of that entirely satisfactory service obtainable exclusively from Bosch Products.

When the question of reliability and continual service are before you remember that ignition plays a most important part; be sure that you specify "Bosch." It is a proven perfect ignition system.

BOSCH PLUGS

"AS GOOD AS BOSCH MAGNETOS"

are a most dependable product and will give thorough satisfaction in any motor. Their indestructible insulator, the absence of threaded washers, the massive, yet neat construction, make Bosch Plugs especially suitable for your cars.

HOFFECKER

MODEL L
COMBINATION

The HOFFECKER SPEEDOMETER

In the Realm of Speedometer Authority "THE STEADY HAND" HOFFECKER reigns supreme. It has stood rigid and exhaustive tests made by some of America's leading mechanical engineers, and has as a result been selected for speedometer equipment on some of the most prominent motor cars.

Its **Superior workmanship** and scientific construction; its every refinement in mechanical detail, distinguishes it as the one PAR EXCELLENT speedometer in both **artistic appearance** and **satisfactory service.**

ABSOLUTE ACCURACY—obtained by a special **individual calibration process.**

A DAILY TRIP—giving intermediate distances which can be **easily** and **quickly** set to any desired mileage.

An instantaneous resetting TENTHS DEVICE, designating fractions of a mile —are some of the **individual** and **exclusive** HOFFECKER features.

There are TWO models furnished either singly or in combination with the **famous** WALTHAM TIME-PIECE.

Discriminating users specify the HOFFECKER, the speedometer with **continuous service**—Seventh year of DEPENDABILITY.

WALTHAM

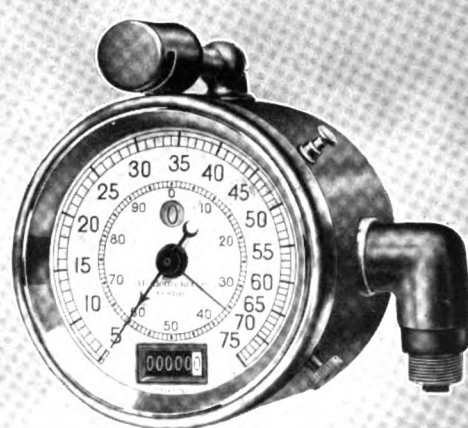
The WALTHAM 8 DAY TIMEPIECE

The past year has but given stronger emphasis to the superiority of Waltham 8 Day Time-Pieces—has proved conclusively that they are like Waltham Pocket Watches in a class unapproachable in reliability.

They have been used under all the varying conditions to which a car can put them and found to be absolutely dependable time-pieces.

They are built to Waltham Standard, which means they are the acknowledged leaders of the world.

They are the only 8 Day Time-Pieces that have 15 jewels and adjusted to temperature; movement runs 8 days; has winding indicator.



Two of the models are cased to match Hoffecker Speedometers, thus insuring artistic uniformity of speed and time equipment, all with greatest efficiency.

For sale by leading jewelers and auto supply houses. Interesting, illustrated literature free.

BY USING

TRADE MARK

Raybestos

REG. U.S. PAT. OFF.

"THE ORIGINAL AND BEST ASBESTOS BRAKE LINING"

Why Accept Inferior Imitations of RAYBESTOS---Cheap Substitutes That May Fail In An Emergency?

We can't make this too strong—*nothing* is so all-important as efficient brake lining—likewise nothing is so all-important as RAYBESTOS. Consider the accidents, the lives lost, the trouble due to faulty brakes.

You wouldn't put your faith in "quack" medicines if your life was in the balance—Then why consider inferior brake lining?

On the hills, in traffic, at the crossing, your life and the lives of the occupants of your car are dependent upon the brakes. Don't take chances—don't flirt with danger. Demand RAYBESTOS lining as part-equipment on your car. If you need new lining tell your dealer or garage man to sell you RAYBESTOS.

Make That Car of Yours a Safe Car!

See The ROYAL EQUIPMENT CO. Exhibit At the Automobile Show

Men Will Want

These Things This Year in a "40"

Mark all the features listed below this cut.

Note the four forward speeds, the overwide tires, the center control, the left side drive.

Note the electric lights, the 14-inch cushions, the roomy, 22-coated body, the 50-inch rear seat.

Note the big springs, the big brakes, the immense over-capacity.

And note the price at which these things are given. Does any Forty you know make a comparable offer?

All Men Will Know

Our dominant advertising, all the time, keeps all these facts before motor car buyers.

They are bound to know—just as you know—that these things all belong to up-to-date cars.

And they'll know that no other car in this class makes an equal offer at the Michigan price.

It's a Cameron Car

This is not the product of an obscure engineer. It is built by W. H. Cameron, a man whose work is known the world over—who has built 100,000 successful cars.

The body is designed by John A. Campbell, whose body designs have been chosen by kings.

The concern back of the Michigan is one of the largest and strongest of its kind. And we waited four years to perfect this car before we came out in the limelight.

Scores of the ablest men have given their best to it. And 5000 Michigans have been put on the road to test their 300 improvements.

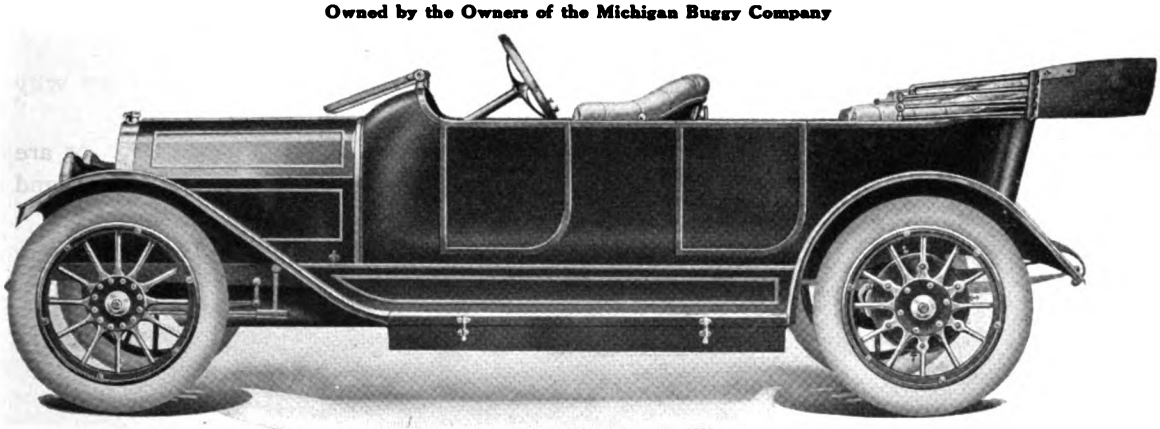
The final result—the latest Michigan model—is one of the greatest cars of the day.

World-Wide Fame

The car has jumped, in the past four months, into almost world-wide fame.

Experts have come here from 11 foreign countries. They have selected the Michigan to compete in Europe with the finest foreign cars.

Hundreds of American dealers, who know the whole market, have chosen the Michigan as the greatest car in its class.



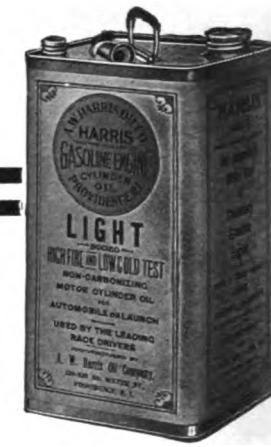
Such a verdict can't be avoided by any man who knows the facts.

We invite dealers and users to send for our catalog and the facts which they wish to know.

(139)

MICHIGAN MOTOR CAR COMPANY, Kalamazoo, Michigan

Owned by the Owners of the Michigan Buggy Company



SOME OF THE MICHIGAN FEATURES

Four-forward speed transmission
Oversize tires—35x4½
Electric lights and dynamo
Center control—left-side drive
Motor, 4¼x5¼
Extra effective brakes—16x 2¼ ins.
Big, comfortable springs
Adjustable steering post
Adjustable pedals
Firestone Q. D. demountable rims—extra rim
14-inch Turkish cushions
Rear cushions 50 inches long
Hand-buffed leather upholstering
Best curled-hair filling
Wheel base, 118 inches
Nickel mountings
Large over-capacity, giving big factors of safety
Pressed steel, full-floating rear axle
Axles sufficient for an 80-horsepower car
Genuine cellular-type radiator
Best mohair top, side curtains and envelope
Windshield built in as part of body
Electric horn
$50 speedometer, 4-inch dial
Special foot rail
Swing robe rail
Rear tire irons
Complete tool equipment
Tool chests under running boards

There is such a difference of opinion about the various types of self-starters that we have not adopted any one type as regular equipment. We prefer to leave this selection to the buyer. We equip with either the gas or a positively efficient electric starter at moderate extra price.

You Can't Get Better Lubricants—

HARRIS

TRADE MARK REG. U.S. PAT. OFF.

OILS

We've been making high grade cylinder lubricants for over 25 years. Isn't it reasonable to suppose that we know *all* there is to know about making oils?

We've an organization of trained oil experts---men who have spent their business lives making oil.

We use the highest grade Pennsylvania Crude Stock---we even pay a premium to get this particular stock because we believe it is the best for automobile lubricants.

We eliminate the damaging soot deposit ingredients. It takes time and knowledge to do this. We feel that we are more successful in accomplishing this result than any other manufacturer of lubricants---at least our customers say that HARRIS OILS produce less deposit than any other known lubricant.

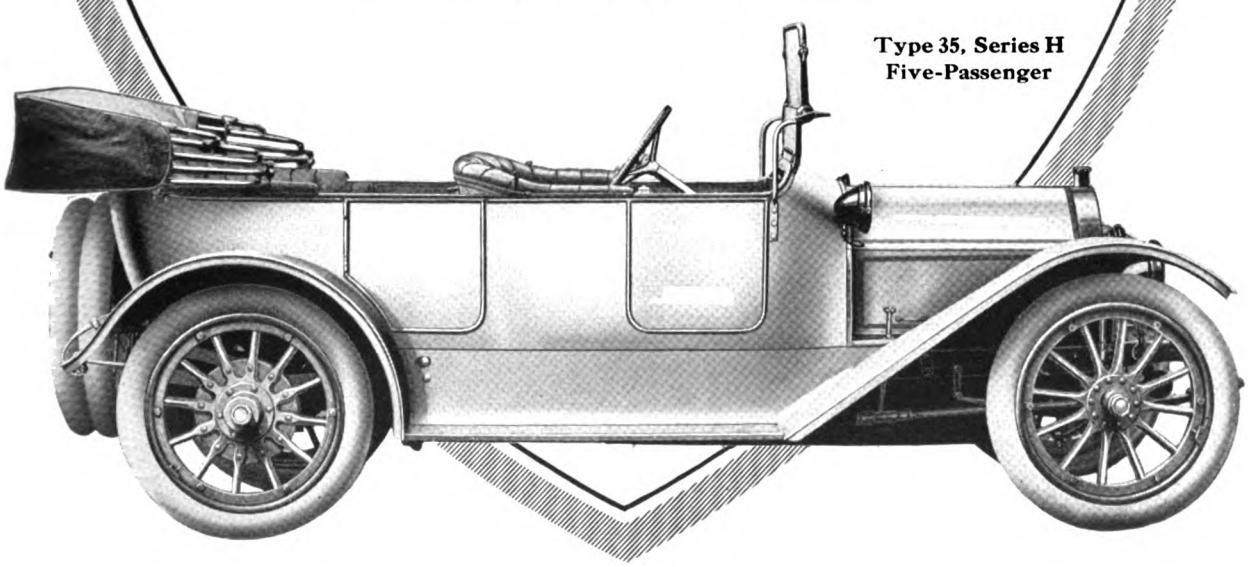
MERCER

ANNOUNCING

Type 35, Series G, Four-Passenger
Type 35, Series H, Five-Passenger
Type 35, Series J, Raceabout
Type 35, Series K, Runabout

A NEW series of Mercer cars that appeal directly to the Motorist who realizes that bulk and weight are no longer essential in a motor car of the highest type. The Mercer is the "happy medium" car — neither too heavy nor too light.



Power, strength, durability, consistency of performance, comfortable riding qualities, graceful appearance, up-to-the-minute appointments, and real legitimate dollars-and-cents value, are what influence wise buyers in their choice of a car. Measured by this standard the Mercer is recognized as leader of the medium-weight class.

Pronounced features are high efficiency motor, perfect lubricating system, reliable steering gear, large and perfectly balanced crank shaft, four-speed transmission, foot brake operating on transmission, springs that give real riding comfort, two-spark Bosch magneto of enclosed type, Rushmore electric lighting and starting systems, both separate units and operating independently of ignition, distinctive and exclusive body designs.

Prices: $2600 to $2900

Elyria-Dean

Dash Coil

Resonator Coil

Elyria-Dean Ignition Systems

High frequency, high tension electrical discharges are used in the new ELYRIA-DEAN Ignition Systems instead of the ordinary high tension discharges, which kind is employed in all others.

This is the new system which has created such favorable results on modern power plants. It gives a new breath of life and "extra ginger," which is so much sought for by the car purchaser.

The high frequency spark differs from all other ignition sparks as it is oscillatory in character, 500,000 to 1,000,000 cycles per second.

It ignites the gas in a different manner, by ionizing, embracing a larger volume and giving more rapid and complete combustion, even of poor mixtures.

Wide spark plug gaps are permissible, 1/16 to 3/32", and the disruptive action of the spark prevents fouling of the plugs. Under average conditions, plugs never have to be removed, unless for mechanical breakage.

High cylinder pressures have less effect on this spark than on the other ignition sparks.

Invisible heat rays, incidental to the high frequency discharge, get in very helpful action and assist in making the combustion rapid and complete.

It allows the lowest of motor speeds without missing—running on the magneto current.

"Self starters" are made successful on magneto ignition as effective sparks are obtained at very low speeds, below 50 R. P. M.

All wiring carries low voltage currents, as the little resonator coils at the plugs step-up the pressure just where it is used. This obviates leakages and the maintaining of high insulation in the magneto, switch and connecting wiring.

It is a perfected product, the outgrowth of the many thousands of successful High Frequency Systems which have been marketed by the High Frequency Ignition Coil Co., of Los Angeles. Many of these systems have been in use for five or six years, and are still giving satisfactory service.

The exclusive manufacturing license has been granted us under the Seeley patents and pending applications, giving us the legal rights and only practical methods of applying high frequency currents to automobile ignition.

We also make the Tuto, a two-tone horn, which sells complete for $25, and the Rexo, a single tone horn, which sells for $8, complete with button and cord.

"Look for ELYRIA-DEAN where quality's seen"

Digitized by Google

Elyria-Dean

Elyria-Dean Speedometer

The ELYRIA-DEAN Speedometer is the most simple and permanently accurate speed measuring mechanism yet devised.

It operates on the unvarying principle of centrifugal force, direct, and without being hampered with compensating gears, springs, etc.

The action is the same on the coldest winter day as in the heat of summer, and without the use of temperature regulators or hand operated compensators.

The speed indications are obtained by four large steel balls, the same as used in the anti-friction bearings of an automobile, operating radially in grooves by centrifugal force, raising a cup shaped member which responds to the slightest increase in speed, whether the car is going forward or in a reverse direction.

The shape of the cup is such that a long scale of uniform division is obtained, direct. No approximating or doctoring of the scale is necessary.

The hand is steady, it shows the speed at a glance by its position and without the necessity of deciphering the figures or markings, yet the latter are larger than usual for a speedometer of the same diameter.

The dial is black with white markings, the case beautifully finished in baked black enamel with nickel trimmings.

The Odometer is the reliable Geneva type of movement with the trip re-set to any tenth mile, so as to follow guide book markings.

It always adds mileage, never subtracts, regardless of how the car runs, whether forward or backward, or whether the shaft is driven from the right or left hand wheel.

There is nothing radically new or untried in the ELYRIA-DEAN Speedomoter. The centrifugal principle was perfected in the FORSE Speedometer (we are exclusive licensees under the FORSE patents).

Every detail has been so nicely perfected that the complete instrument is in strict keeping with the finest made and most luxurious automobiles.

The ELYRIA-DEAN has real speedomoter value, easy reading, steady hand, permanent accuracy, great strength in mechanism and neatness of design and finish.

We also make the Tuto, which sells for $25, and the Rexo, which sells for $8.

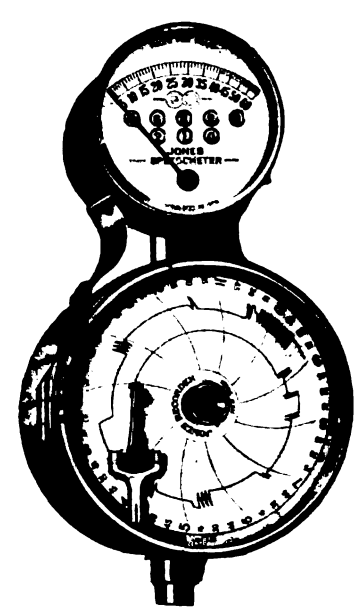
Prevents Unauthorized Use of Car

JONES SPEEDOMETER-RECORDER

The Great Step Forward In Speedometer Construction.

What It Does



Records every movement of car, and gives a record of momentary speed. In other words, it is a speedometer of highest quality and puts the record in black on white. Shows when car left garage. How fast it travelled. When it stopped. How long and how often. It shows the distance travelled in total and between each stop, and the time consumed. And it shows when the car returned to the garage.

What It Is

The JONES SPEEDOMETER-RECORDER is attached to the dash. It is driven by shaft and gears identical with a speedometer. The handsome JONES SPEEDOMETER surmounts the RECORDER, sufficiently ornamental to grace any dash. The RECORDER has an open glass front and chart is always visible—it is fascinating to watch the development of the record as the minutes pass.

Why It Is Absolutely Necessary

Joy riding is an unnecessary evil of motoring—it can be stopped with the JONES SPEEDOMETER-RECORDER. No joy-rider will dare remove a car if he knows that the record of such movement will be shown and indicated to the owner.

Computes Cost Of Car Maintenance

It is a necessity to the man who wants to know how much tires, oil and gasoline cost. It is the only accurate method of computing cost of car maintenance. This instrument adds a new element of interest to motoring.

Car illustrated—5-passenger "Six" Touring—$2850. Fully equipped.

135-inch wheelbase, 36x4½ tires, Electric Starter and Electric Lighting, Independent Bosch Dual Ignition.

See the real motor car sensation of the century

THE NEW SPEEDWELL "SIX" with ROTARY VALVE MOTOR

The biggest innovation in the history of the motor industry makes its first appearance at the New York Pleasure Car Show (Grand Central Palace Division) in this big superbly appointed Speedwell "Six" equipped with the Speedwell Rotary Valve Motor.

Allowing due deference to public opinion we are offering in conjunction with the Speedwell Rotary Valve Motor, a standard high powered six-cylinder poppet valve motor in our standard Speedwell chassis.

The buyer has an option of selecting either poppet or rotary valve motors on any Speedwell "Six" model at exactly the same price.

The Speedwell Rotary Valve Motor.

The primary advantages of this motor are silence, simplicity, freedom from wear, and lack of vibration.

Between 300 and 400 less parts than are required for the prevailing types of six-cylinder poppet valve motors.

No reciprocating parts in valve construction.

Valves revolve at one quarter of crank shaft speed.

Valves cannot get out of time—once set always the same.

No valves to grind and practically no wear—valves that have been driven **100,000** miles show full efficiency.

Power developed is in excess of other motors of equal piston displacement.

A really marvellous motor—simple in the extreme.

We can't convey any adequate idea of this motor's value in cold type—**see it at the show—send for literature.**

OUR EXHIBIT

at the Grand Central Palace, January 11th to 18th, includes a Poppet Valve "Six" Chassis, a Speedwell Rotary Valve "Six" Chassis and complete cars.

4 and 5 Passenger Models $2850—Fully Equipped.
7 Passenger Model $2950—Fully Equipped.

PAIGE 36

A Next Year's Car

Paige "36" Model Glenwood, 5-Passenger Touring Car.
Price $1275, with unparalleled equipment, including Gray & Davis Electric Starting and Lighting System.

NO other manufacturer is building such a car to sell at such a price—maybe later, but *not for this year*. That's why we say the Paige "36" is a *next year's car*. And that's why you, if you are a Paige dealer, will have your competitors at a *disadvantage*.

Does any other car in the Paige price field offer the famous Gray & Davis Electric Starting and Lighting System? Look it up. See if they do. The Paige "36" chassis was *designed* for the Gray & Davis System. It is a *part* of the car.

Look at the Paige "36" clutch---see what other cars offer it. Look at the Paige "36" motor size and design; look at its wheel base, body size, wheel size, ignition. Compare the car, through and through, with *any* car at a competing price. Compare not only design and equipment, we want you to compare materials and workmanship, too. We will be satisfied with your judgment when you've made the comparison.

Consider these Features of Design and Construction: Left-side drive, center control. Silent chain drive for cam shaft, pump and generator (enclosed). Cork insert multiple disc clutch. 116-inch wheel base. 4x5-inch motor, cast en bloc. Unit power plant. Enclosed valves. Selective type transmission. 34x4-inch tires, demountable rims. Floating type rear axle. Full elliptic scroll rear springs. 14x2-inch brake drums. Imported annular and Hyatt roller bearings. Aluminum crank and transmission cases. Gasoline tank under shroud dash. Dash adjustment for carburetor. 17-inch steering wheel, irreversible gear. Rear door, 21 inches wide. Front door, 19 inches wide. 10-inch upholstery. Deep, tilted cushions. Long, clean, linoleum covered running board. All dash equipment, speedometer, ammeter, carburetor adjustment, magneto and lighting switches, etc., imbedded in auxiliary dash, convenient to operator.

Could this Equipment Be More Extraordinary? Gray & Davis electric starter. Gray & Davis electric lighting system (generator and electric motor in separate units, storage battery and all connections, switches, etc.) Bosch magneto. Ventilating windshield, built into body. Silk mohair top (tan lined) side curtains and boot. Stewart revolving dial speedometer. Heavy nickel trimming throughout. 12-inch electric head lights (parabolic design), black enamel and nickel. 5-inch electric side lights, flush in dash, crystal cut lens. 3-inch electric ruby light at rear. 34x4-inch tires. Five demountable rims. Adjustable foot rest. Nickel robe rail. Extra tire irons. License brackets. Horn, pump, jack, tools, tire repair outfit, etc., complete.

FIVE TYPES OF BODY:

5-passenger Touring Car..Model Glenwood
3-passenger Roadster.....Model Westbrook
Raceabout.....Model Brighton
4-passenger Coupe.....Model Montrose
5-passenger Sedan.....Model Maplehurst

A FEW LOCALITIES ARE STILL OPEN FOR RESPONSIBLE DEALERS.

The Paige "25," selling for $950, is just as attractive a proposition as the Paige "36." Paige offers you **the car,** the **advertising support,** and a **strong company that has made good back of all this.** Write us to-day.

Model B
$50

IT'S KNOWN BY ITS 4 BIG FEATURES

Our magnificent new 1913 instrument is an example of highest development in the construction of a

Magnetic Speedometer

The magnetic principle is the only principle of speedometer construction. It is—by far—the most costly construction. The magnetic principle--alone permits the use of a frictionless indicating means and of low speed, non-vibrating drive.

THE NEW 1913

Stewart Speedometer

Has Four Splendid Features

The New 1913 Stewart Speedometer has the new "reversed" revolving Speed Dial with Zero Stop mounted on full jeweled bearings and operated by Tungsten steel magnet, Stewart "closed ring" type. Steady and accurate at all speeds. Read at a glance.

It has a big, sturdy 100,000-mile Season Register, operated by "direct drive" gears and controlled by "Geneva Stop" mechanism.

It has a 100-mile Trip Register that can be rapidly reset to any tenth of a mile, and without disturbing the record of the Season Register. This is an excellent feature for motorists when following instructions of route book while touring.

It has the Grade Indicator with revolving dial mounted on polished bearings and operated by gravity. Shows the various percentages of grades from zero up to 30 degrees.

We Threw It Away

Our Old Centrifugal Type Speedometer

The first speedometer we made was of the centrifugal type—but long ago we cast it upon the scrap heap of the obsolete—

—because the governor of a centrifugal instrument must revolve at a high speed of over ***two thousand five hundred revolutions*** to the mile, causing friction that no instrument can stand.

—because the centrifugal type ***will not indicate*** any speed under seven miles an hour!

—because continued accuracy with a centrifugal type of speedometer is utterly impossible. It is necessary to multiply the movement of the indicating means ***sixteent imes*** in order to get a movement of the pointer hand sufficient to permit of the use of a scale large enough to be readable. ***Therefore, any error in accuracy is multiplied sixteen times!***

—because our new and perfected type of MAGNETIC speedometer has rendered all types of centrifugal speedometers crude and obsolete!

IF YOU DESIRE PERMANENT SATISTION, SEE THAT THE MAGNIFICENT NEW 1913 STEWART SPEEDOMETER IS INSTALLED ON THE CAR YOU BUY

American made for American trade

American made for American trade

New Departure Guaranteed Ball Bearings

are the supreme expression of the bearing builders' art—up to the minute.

They are made by American methods and in every way satisfy the exacting requirements of the American trade. The fact that these bearings are in more than 75% of American built cars for 1913 proves the quality of the bearing and the advantage to the American manufacturer of installing it in his car.

Manufacturers have preferred New Departures because—

QUALITY OF STEEL—Our experts have found a steel that is particularly adapted to ball bearing work because of its great strength, resiliency and toughness. The development of this steel is the result of many months' study, experiment and testing in our chemical, metallurgical and physical testing laboratories. Each lot of steel coming in is scientifically analyzed in our engineering building before it is sent into the factory. If it does not hold up to established standards it is rejected. The user of New Departure ball bearings is, therefore, assured that the material in these bearings is adequate and satisfactory and superior for the special work the bearings are called upon to perform.

QUALITY OF WORKMANSHIP—We employ the best mechanics we can find—this in line with our determination to maintain a high quality that will not be excelled anywhere in the world. Our plant is equipped with the most modern machinery, including machines of our own invention and used exclusively in our plant. Our system of inspection is a continuous check against poor workmanship, each bearing being inspected not less than 31 times during the process of manufacture.

QUALITY OF FINISH—New Departure ball bearings are more insistently gauged and tested for uniformity of dimension and strength, for accuracy of finish than is any other. Our inspectors work within exceedingly close limits and discard for slightest imperfections that might be overlooked.

New Departure ball bearings are made in three types:—

Double Row—Combined radial and thrust.
Single Row—Strictly radial.
Radax—Radial and one-direction thrust.

See the interesting exhibit of this American made ball bearing at Madison Square Garden Automobile Show, Space No. 204, Balcony, both weeks.

No-Rim-Cut Tires
10% Oversize
By Far Outsell All Others

This Winter Tread

Will Indicate Why the Goodyear Won

Last year we sold 918,687 automobile tires.

Yet we failed to keep up with the flood-like demand by some 400,000 tires.

Seven years ago only one tire in ninety was a Goodyear tire.

Three years ago the demand was still one-twelfth as large as now.

Last year's sales by far exceeded our previous 12 years put together.

What has awakened men to Goodyear tires in this overwhelming way?

This winter tread will tell you. It shows how far we go, in every way, to multiply efficiency. To cut down tire expense.

This is only one item, but it reveals the entire Goodyear code.

Compare this tread with others, and you'll see why Goodyears won.

Note the Double Thickness

In this Non-Skid tire we add an extra tread almost as thick as the regular. Thus we give you a double-thick tread.

This extra tread is of very tough rubber, immensely enduring, almost impervious to wear.

Because of its thickness, the blocks are deep cut. Their non-skid efficiency lasts for thousands of miles.

A Bulldog Grip

These sharp-cut blocks present to the road surface countless edges and angles.

They grasp the road in every direction with a fairly irresistible grip.

But the greatest advantage lies in the fact that these blocks widen out, so they meet at the base.

They are not separate projections, which centre the strain on a small part of the fabric. They distribute the strain exactly the same as with smooth-tread tires. That's the main reason why the Goodyear Non-Skid gives such exceptional mileage.

Compare this tread with others. Compare its thickness, the depth of its projections. Compare the apparent efficiency, due to these sharp-cut blocks.

Compare the way in which strains are distributed so the fabric can't be broken. One glance will show you that this Non-Skid surpasses anything else of its kind. About 250,000 of these treads have already been tested out.

Other Troubles Ended

Thus we have ended skidding troubles in the most effective way.

Years ago we ended rim-cutting, just as completely, just as efficiently.

Our patent tire—the No-Rim-Cut tire—has made rim-cutting simply impossible.

And that alone cut tire expense 25 per cent.

Our 10 per cent. oversize, under average conditions, adds 25 per cent. to the tire mileage.

Our 14 years of ceaseless tests and comparisons have brought our tire quality up to the maximum.

These things together, in the test of time, have placed the Goodyears on at least a quarter million cars.

One Must Respect This Verdict

Remember, please, that tire expense forms your major cost of upkeep.

A tire which cuts that cost in two is something quite important.

Men know when they get it in these days of odometers. They know which tire serves best. And the final verdict of these men who know favors Goodyear tires.

Men have tried and compared now pretty close to 2,000,000 Goodyear tires. As a result the sale of these tires has doubled every year. And last year's increase was 125 per cent.

Now these tires by far outsell all others. And this year's output, if this increase continues, will completely equip 500,000 cars.

One may easily question any maker's claims. But when hundreds of thousands of users unite, one must respect their verdict.

The verdict of experience favors Goodyear tires in an overwhelming way. And every month makes the verdict more convincing.

Is it not fair to suppose that your experience will bring a like result?

If you think so, get that experience. Make some comparisons. Settle this question by next time insisting on Goodyear No-Rim-Cut tires.

The New Cartercars Are Even Better!

In the new Cartercar Models Shown here you will find all the good features of the previous Cartercars with a few improvements and the very latest ideas in body designing. We are certain that, when you ride in any of these, your verdict will be "A Very Good Car."

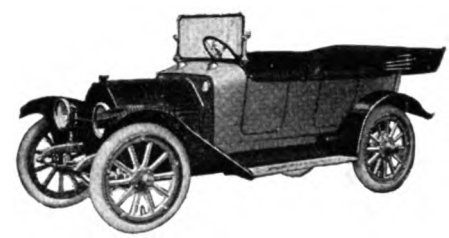
New Electric Starting and Lighting System

Just press down a small knob and the engine is cranked—turn the same knob and you light all or as many of the lamps as you wish. Simple, isn't it?—yet it is always reliable. We have tried this system out under all conditions and it has proven 100% efficient.

Friction Transmission the Same

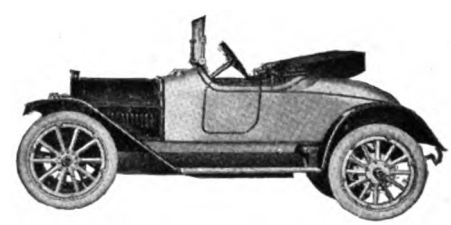
We didn't even try to improve the Friction Transmission. This feature is largely responsible for the great popularity which the Cartercar is enjoying today. You have still the unlimited speeds—the one lever control—and all Cartercars will still climb 50% hills as easily as ever.

Save 1-3 to 1-2 of Your Tire Bills



Jerks and jars are eliminated by the Cartercar Friction Transmission. You can easily see how this means a much greater mileage from your tires. Many owners say that they have secured about twice the ordinary wear. Of course, this smooth running means less upkeep expense for all parts.

The Service You Want



You don't have to consider whether the roads are good—or the weather satisfactory. Your Cartercar will travel up hills and through mud and sand. The Friction Transmission is the strongest and most efficient feature of the Cartercar.

At the Shows

We will exhibit at all of the big winter shows and will be pleased to meet you there. Let us send you our catalogue now.

KISSELKAR

—the car of liberal design

Every Inch a Car

Liberal design means greater comfort, greater durability, more impressive appearance, lower up-keep and slower depreciation. It is one of the factors that separates the KisselKar from average automobiles, and and makes it a conspicuous value—a distinctive achievement of motor car engineering and manufacturing.

SIT in a KisselKar—immediately you sense the unusual roominess of the tonneau—one factor of the liberal KisselKar design.

Lounge back in the seats—here is another surprise, a result of liberal design. Never before have automobile seats been made so exceptionally deep, encouraging the completest relaxation. This, and the 11 inches of softest upholstery give you the most luxurious ease.

Ride in the KisselKar—there's a steadiness and softness of motion immeasurably superior to every previous idea of car comfort—it is **super-comfort,** due to liberal design.

The generous KisselKar wheelbase is the basis of this rare riding comfort. If a car is to be roomy, and at the same time have the "balance" which causes a car to ride with steadiness and handle responsively, it must have a liberal wheelbase in proportion to the roomy body. No car can equal KisselKar roominess, comfort and ease of driving without equaling the wheelbase—and few cars do.

Ride on rough roads—here is where the liberal KisselKar design discloses its comfort value. The generous wheelbase modifies the irregularities of the road—springs built according to the weight of **each** model—shock absorbers and 11 inches of resilient seat upholstery absorb the road vibration. The unusually deep seats permit you to relax in a way so that sidesway or lurches do not disturb you—no tendency to brace yourself.

Every part of the car shows the liberal KisselKar design—transmission, differential, steering knuckles, brake drums, etc., securing a greater safety margin, minimizing up-keep and depreciation.

Go to a KisselKar dealer. He will afford you every opportunity to convince yourself of KisselKar superiority—the super-comfort, the distinction and the roadability by which the KisselKar gives the owner a pride and satisfaction he can secure in no other way.

KisselKar Service cares for your car. Specially equipped buildings are maintained by the manufacturers at principal points of America. As service-centers, carrying complete stock of spare parts, supplying service direct, and through co-operation with sales agencies.

13,055 Magnetos Shipped in October. *13,165 Magnetos Shipped in November.*

1913 sees more Remy Magnetos in use than all others combined

MORE than three hundred of the most representative organizations in the entire automobile industry chose the Remy Magneto exclusively for 1913.

More than three hundred of the greatest engineers in the industry gave this action their stamp of approval.

More than ten thousand dealers were previously consulted by the manufacturers.

More than three hundred thousand satisfied users of Remy Magnetos during 15 years gave volume to this tidal wave of demand for the Remy Magneto for 1913.

And the many years of Remy success is emphasized in the 1913 season, when the greatest attention is being paid to choice of equipment.

Are these facts significant to you

The Remy Electric Company is the pioneer manufacturer of magnetos in this country---one of the first in the world.

It is the world's largest manufacturer of magnetos.

It created "Ignition Service."

We have more than fifty branches and service stations in North American motoring centers for intelligent service to Remy users.

More than 1000 men are employed to build Remys.

This great force facilitates construction and deliveries with scientific, automatic, time-saving, accurate machines---protected by a fire-proof factory.

These men are electrical and mechanical experts drawn from every civilized country of the globe.

The Remy Electric Company has as a result of its tremendous volume greater buying facilities than any other ignition concern.

These facts, combined with the simplicity of the Remy construction, make it logical for the Remy Electric Company to offer the best motor car electrical equipment for the lowest legitimate cost.

1½ Cents a Day

By R. E. Olds, Designer

Here's an interesting fact about upkeep cost.

About 300 Reo the Fifths are now in use in one city. One man in our agency keeps them all in shape.

In another city 400 are in use. One man, with half the time of another, keeps those 400 cars in tune. The cost per car will average 1½ cents daily.

The Reason

That's one result of what men call my extremes.

It is due to analyzed steel, to machine-tested gears.

It is due to 190 drop forgings, to 15 roller bearings. To giving each part a big margin of safety.

It is due to big springs, big tires, big brakes—to a $75 magneto.

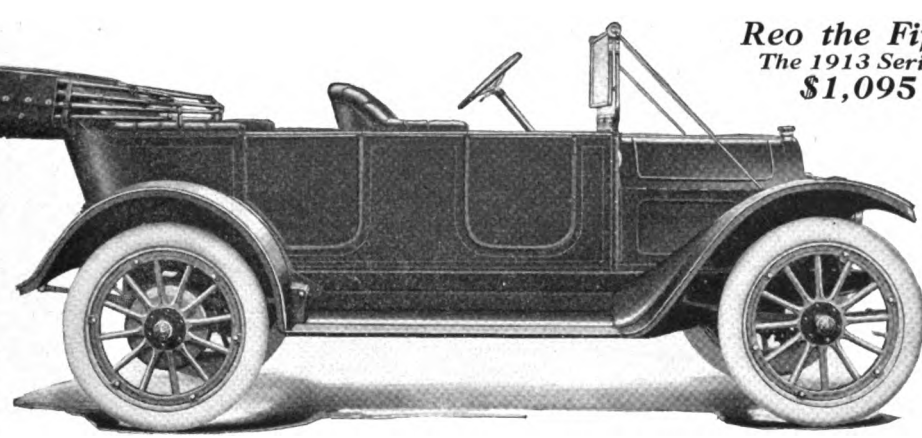
It is due to slow, careful building, to a thousand inspections, to 48 hours of engine tests.

These things add to the making cost, but the facts above show how well they pay.

Center Control

This car is controlled by a single small lever. The gear shifting is done by moving this lever only three inches in each of four directions.

No side levers, no brake levers—nothing in the way. Both brakes operated through the foot pedals.



Left-side drive with right-hand control, like all up-to-date cars. But the simplest control ever known in a car.

Dealers in a thousand towns. Write for our catalog and address of the nearest.

R. M. Owen & Co. General Sales Agents for **Reo Motor Car Co., Lansing, Mich.**

This is the Cole "50" Electric Starting Touring Car
$1985

Leave comfort, convenience and beauty lines to her—she is leaving the price and mechanical correctness to you.

Make the purchase of your next motor car a domestic business transaction.

Recall how you and the wife built the home. You bought the lot where values were right and selected the architect on the strength of his reputation. You watched the plumbing—you planned the heating plant. You demanded nothing but "bests" in the entire construction.

You left the social environment, the convenience and the interior decorations to her—this was *right*.

When you have applied the same method to the purchase of a motor car and have selected your Cole, two things will have been satisfied—a woman's intuitive appreciation of beauty and a man's cold business judgment.

Series Eight

COLE

comes in three chassis—all equipped with Delco electric starting, lighting and ignition.

Cole "40"—116-inch wheel base, completely equipped, $1685.

Cole "50"—122-inch wheel base, completely equipped, $1985. New Cole Six Cylinder "60"—132-inch wheel base, completely equipped, $2485. No difference in quality—merely diamonds of varying karat.

"So far, so good"—you say.

All right. Now let's fill out the coupon below. It doesn't obligate you. Back will come the Cole Blue Book for "her"—the Technical Bulletin for you. Your business judgment will prompt you to send the coupon by return mail—before you lay this magazine aside.

Cole Motor Car Company
Indianapolis

Tell her that you can "see" the Cole at the New York Show in January or the Chicago Show in February.

"OUR" COUPON REQUEST

COLE MOTOR CAR CO., Indianapolis.

We have decided that the Cole is worth investigating. It is understood that we assume no obligation in asking for the Cole Blue Book and the Technical Bulletin — so send them by return mail, all carrying charges prepaid.

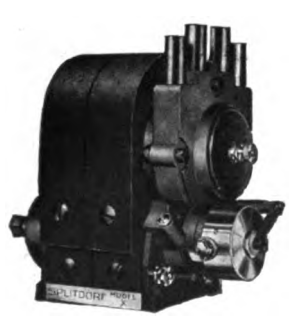
SPLITDORF

"Always There"



SPLITDORF ignition devices are making rapid headway in the choice of owners and drivers of the automobile, the motor truck, the motor boat, the motorcycle, the aeroplane and the motor driven farm implement. Sheer merit has brought them to the front in the face of the closest competition.

SPLITDORF PLUGS are not experimental---they are STANDARD. Known since their first appearance as the "common sense plug," they are exactly that---no more and no less. SPLITDORF PLUGS will outlast your motor. There is nothing fanciful about them---they are made to endure any and every strain of ignition put upon them.

Four magnetos of the well-known SPLITDORF low tension type are making their appearance for the first time, minor structural changes on the older styles giving the latest models a smoother and more compact appearance. Models "W" and "Z" are of the 3-pair magnet type, designed for heavy, low speed 4 and 6-cylinder motors respectively, while the "X" and "Y" are of the 2-pair magnet type for 4 and 6-cylinder motors respectively, in which efficiency has been raised to the highest standard.

If interested in any form of ignition for gasoline motors, just write in for our free literature. Our new catalog, our "Racing Record" or our "New Lights For Old" is yours for the asking. Do it TO-DAY.

"Quality of a Master"

The LENOX

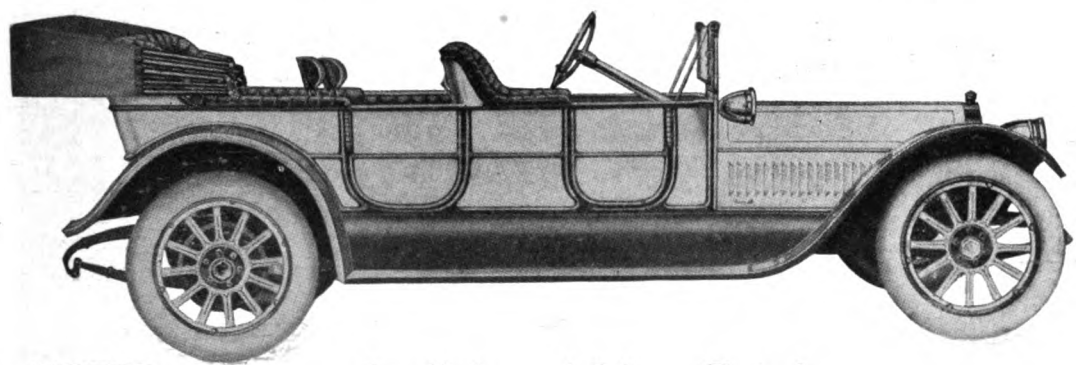
Price and Quality Considered, No Better Car Made Than The Lenox

Make us prove this statement---call at our booth at the **Grand Central Palace, space 114---**examine the models shown, see the quality of workmanship, design and finish, look over carefully, the electric lighting and starting system, the left-hand drive, centre control, long-stroke flexible motor, the long wheel base, the large wheels, over-tired, the big roomy bodies, the deep luxurious upholstering, note carefully the equipment, embracing every detail for your comfort. THEN---step outside and let us demonstrate the Lenox recognizes no hill too steep, or road too rough.

Next consider the price---for the **"4"** cylinder **$2000,** fully equipped.

The **"6"** at **$2750.**

If you are a prospective car-owner can you afford not to visit our booth?



THE LENOX MOTOR CAR COMPANY

Factory: Jamaica Plain **Salesroom: Motor Mart**

AUSTIN

Has More New, Improved and Distinctive Features Than Any Other Car

MOTOR	**6 cylinders. 4½" bore, 7" stroke.**
SELF STARTER	High-pressure air system, having a special air pump maintaining 150 lbs. pressure in a large tank from which there is also a connection for instantly filling tires with pure air.
IGNITION	Two sets of spark plugs, with double spark dual magneto, firing each set separately or both sets of plugs at the same time.
LEFT-HAND STEER	With right-hand center control, giving a much quicker view of the road ahead when passing any vehicle, and allowing the use of both front doors.
TRANSMISSION	Selective type. Four forward speeds. The center control lever is very short, and has a ball and socket joint at the floor connection, eliminating all holes or slots in the floor. The segment and also the clutch interlocking device are absolutely positive and are entirely enclosed in the transmission case.
CUSHION SPRINGS	Entirely new double construction. Exceedingly soft and flexible, and still very strong and durable.
BOTH BRAKES ARE CONTROLLED BY FOOT PEDALS	A slight movement of the clutch pedal entirely releases the clutch and at the same time takes up the slack of the emergency brake which is fully engaged by a further movement of the clutch pedal. The service brakes are also operated by a foot pedal. This arrangement eliminates the hand brake lever and enables the operator to handle both clutch and brake with one foot when desired, leaving the other foot free to operate either the exhaust horn or accelerator. *Also, both brakes can be applied instantly without taking either hand from the wheel.*
ELECTRIC LIGHTING	Powerful Generator, driven by enclosed gear, furnishing 20 amperes at moderate speed. 32-c.p. Head Lights, 16-c.p. Side Lights and 4-c.p. Tail Light. A combination switch controlling all lights as desired, including a dimmer for the head lights. Edison Storage Battery.
NINE PASSENGER BODY	Can be furnished at a small extra cost.

Write for our special introductory proposition to agents and owners in unoccupied territory.

Model "77" Six Cylinders, 4½x7, - $6000.00
Model "66" Six Cylinders, 4½x5½, $5000.00
Model "55" Six Cylinders, 4x5, - $4000.00

If selling tires is your *business* why not be the *representative* dealer in your community?

It is possible for every tire dealer in the country to occupy the same dominating position in his own field that the United States Tire Company occupies in the Nation.

He can be a *leader.*

Four-fifths of all the best dealers now handle United States Tires, and there are many decidedly logical reasons why these men, interested in the future of their business and in the welfare of their customers should line up with this organization.

In the first place, no one seriously disputes the leadership of the United States Tire Company in the tire field. Its factory resources are epoch-marking in the history of the tire industry—four immense plants where tires are manufactured with the one fixed purpose of producing a uniform standard of quality.

Tires made as United States Tires are made can safely be sold under any good dealer's personal recommendation.

Added to these magnificent production facilities is a comprehensive sales organization which places the dealer always in close touch with the factory output.

And behind these manifestly advantageous resources is the United States Tire Company's policy of co-operating with the dealer instead of competing with him.

Do you know of any more certain way to dominate the tire field in your own particular community than by selling America's *Predominant* Tires, with the co-operation and backing of the world's leading tire concern?

"There's Where YOU Are Wise!

That Other Fellow is a Menace to Everyone's Safety"

Nine-tenths of all automobile accidents are caused by skidding and by foolish dependence on rubber alone. In these days of crowded streets and congested traffic, the motorist who does not take precaution to guard against every possibility of disaster is **next to criminal.**

"The ever-present danger that is quite as much of a terror to the experienced driver as it is to the novice is **skidding.** There is nothing that makes a man lose his nerve so thoroughly or dread a repetition of the experience so keenly as a bad skid that ends in a broken wheel against a curb, or that makes matters far worse by 'side swiping' a moving trolley car. To feel the car start to slide from under you, aiming directly at the nearest obstruction, despite all manipulations of the wheel and brakes—well once is too often."

Weed Chains *vs.* Slipshod Traffic

Traffic policemen, by the hundreds, interviewed in all the large cities throughout the country, express the unanimous opinion that their work would be greatly reduced; that nearly all **skidding accidents would be eliminated** if motorists would take the precaution of always carrying WEED CHAINS, and putting them on when roads and pavements are wet, slippery and uncertain, or covered with snow.

Some of these **guardians of public safety** go so far as to say that the time is not far off when State Legislatures will make **the use of WEED CHAINS compulsory,** for the protection of life and property.

Make Safety Yours —take no chances. Fully equip your own car with WEED CHAINS and **insist,** for your own protection, that other drivers do the same.

On The Rear Tires —they afford perfect traction and adequate brake control.

On The Front Tires —they act as ladders to enable the front wheels to easily climb out of mud-ruts, car-tracks and all uneven places in pavements or roads, always insuring absolute steering control, eliminating all chance of the front wheel skid.

If you haven't a set of **WEED CHAINS,** or if you have a pair for the rear tires only, **get a full equipment now.** Delay is dangerous. Stop at your dealers today and **WEED CHAIN your car to safety.**

FOR SALE BY ALL REPUTABLE DEALERS **Weed Chain Tire Grip Co., 28 Moore St., New York**

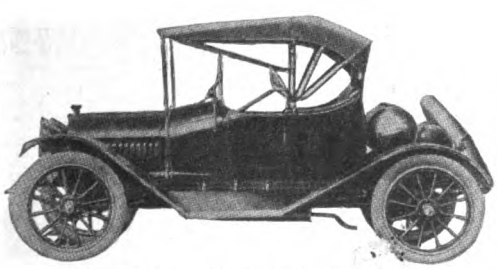
WHAT THE EXPERT SEES

1. The famous Rutenber Motor with enclosed valves.
2. Remy high-tension Magneto.
3. Schebler Carburetor.
4. Flexible coupling between motor and transmission.
5. Large end thrust bearing back of disk.
6. Lambert Patented Friction Plate.
7. The Lambert removable friction Fibre.
8. Two brakes on each rear wheel.
9. The Renold Silent Chain is thoroughly enclosed in a quick removable dust tight metal case.
10. Flexible suspension of the jack-shaft which is mounted on gimbal bearings.
11. Full elliptic springs are just as necessary on an automobile for easy riding qualities as on a buggy.

Ninety Horse-Power Salesmen Not Needed
Popular-Priced Cars for Progressive Dealers



The ideal of motorists has ever been a gearless car, operating without noise, shock or jar.

In the LAMBERT this ideal has been reduced to an exact science, brought to practical perfection and then proved emphatically right in every form of service from pleasure cars to five-ton trucks.

Friction Drive has the advantages of economical operation—requires practically no skill in manipulation and no injury to the parts is caused by sudden shocks upon the gearing, either as a result of careless handling or inequalities of the road. It appeals to the motorist's mechanical common sense and to the owner's pocketbook.

In addition, the LAMBERT combines all the best features of high-price gear-drive cars such as the Rutenber Motor, Remy Magneto, Schebler Carburetor, I-beam front axle, Renolds Silent Chain, full elliptic springs, together with such features characteristic of LAMBERT construction as follows: Flexible coupling between motor and transmission, large end thrust bearing back of disk, LAMBERT composition friction plate, automatic release of brakes when transmission is engaged—yet at prices that meet the popular demand.

These facts make the LAMBERT 1913 car a most attractive proposition to the sales agent and enable him to make two sales as easily as one can be made with a gear-drive car at the same price.

One of the Squadron of Twenty-Four White Motor Trucks Owned by Armour and Company, Chicago, and Operated by them in the Principal Cities of the United States

WHITE MOTOR TRUCKS

The predominant use of White Motor Trucks by the foremost mercantile and manufacturing firms, not only in the United States, but throughout the world, is the most convincing proof of their superior merit in practically every line of service.

A Few Well-Known Owners of White Squadrons

American Can Company	Joseph Horne Company
American Chicle Company	Hudson's Bay Company
American Steel and Wire Company	Illinois Steel Company
Armour and Company	McCreery and Company
Berghoff Brewing Association	National Cash Register Company
Booth Fisheries Company	Pabst Brewing Company
Brazilian Government	Philippine Islands Government
Coca-Cola Company	Postum Cereal Company, Ltd.
Cudahy Packing Company	Remington Typewriter Company
Diamond Rubber Company	Russian Government
T. Eaton and Company, Ltd.	W. and J. Sloane
Marshall Field and Company	Standard Oil Company
Gimbel Brothers	United Cigar Stores Company
B. F. Goodrich Company	United States Government
Gulf Refining Company	Winchester Repeating Arms Company

White Motor Trucks are built in capacities of 3-4, 1 1-2, 3 and 5 tons, and all models are uniform throughout in parts and design, thus making them the most practical for the standardization of delivery or transportation service. Literature and detailed information furnished on request.

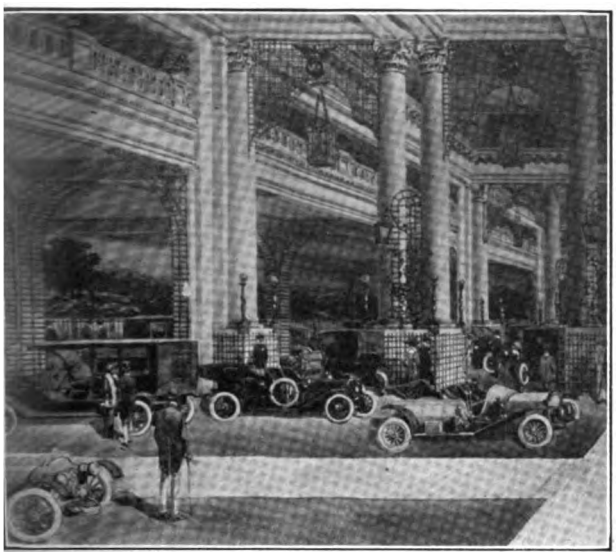
THIRTEENTH NATIONAL AUTOMOBILE SHOW.

Big Double Display in Madison Square Garden and Grand Central Palace, New York City, in Marked Contrast to the First Exhibition of This Character in 1900—Pleasure Cars, Jan. 11-18; Business Vehicles, Jan. 20-25.

THE 13th national automobile show in New York City will be opened in Madison Square Garden and Grand Central Palace, Jan. 11, to continue for two weeks, the first period, Jan. 11-18, being devoted to pleasure cars and the second, Jan. 20-25, to commercial vehicles. Manufacturers of accessories will make display both weeks, and in addition members of the National Machine Tool Builders' Association will exhibit during the second period. Motorcycles will be shown this year at the Grand Central Palace in connection with the pleasure vehicle display. The exhibition will be under the auspices of the Automobile Board of Trade, the show committee being composed of Col. George Pope as chairman, Merle L. Downs as secretary and Alfred Reeves.

Thirteen years ago the first national automobile show was held in Madison Square Garden. This was not the initial exhibition of motor vehicles in America, but the first to be organized in a manner to represent the industry as a distinct enterprise. There were only 31 exhibitors of motor cars and motor bicycles, and 20 of accessories. Elsewhere in this issue will be found a complete list of the exhibitors at the forthcoming display, and these will number very nearly 600, including those for both weeks.

In 1900 the management was confronted by no special problem in finding room for those who desired to exhibit their products. The main floor of the Garden was abundantly large for the vehicles and outside of the area reserved for exhibitors a flat, oval track was constructed in order to permit of demonstrating the machines on view. In addition, an incline was erected on the roof so that any question regarding the hill climbing ability of the cars could be answered satisfactorily. Persons who wished to cross from the enclosure to the booths about the sides of the building, where the accessories were displayed, were obliged to cross a bridge spanning the track. This year, two buildings are hardly sufficient to meet the demands of those who would make display, and it is not anticipated there will be disposition to question the capacity of the vehicles.



Interior View of Madison Square Garden During First National Automobile Show in 1900—Note Race Track Utilized for Demonstration Purposes.

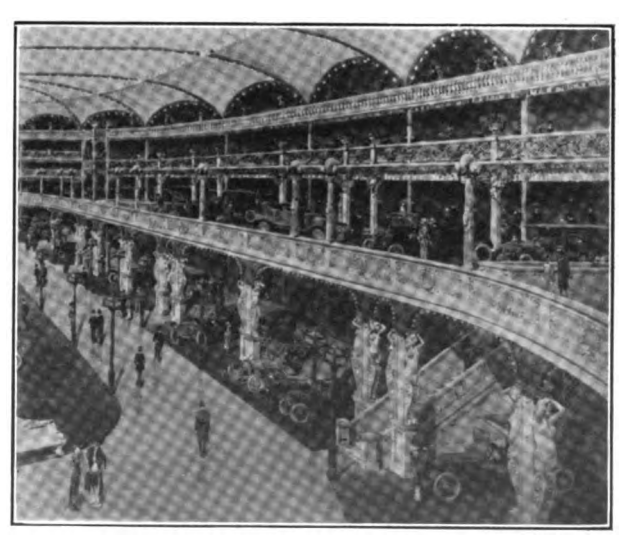
At that first show, steam machines easily were in predominance, with a goodly number of electrics, while gasoline cars were a bad third. Some of the exhibitors of the latter type were: Winton Motor Carriage Company, with the two-passenger phaeton which made the run from Cleveland to New York, and a special racing car, both driven by single-cylinder engines; a single-cylinder Packard; a three-wheeled Knox; a two-passenger motorette constructed by the Peerless

Digitized by Google

Manufacturing Company, with an imported De Dion motor; a surrey displayed by the French Bros., which attracted considerable attention be-

Sectional View of Main Floor and Balcony in Grand Central Palace During Forthcoming Exhibition.

cause it had come down over the road from Boston; a three-cylinder car shown by the American Bicycle Company, and the line presented by Haynes & Apperson, who were then associated.



Easily one of the leaders was the Locomobile, at that time a steam vehicle, with no less than 10 different models. The most important factor in the electric field was the Riker Motor Vehicle Company, which afterwards was taken over by the Electric Vehicle Company. Other exhibitors of electrics were the Woods Motor Vehicle Company, which had a very representative line, and the Baker Motor Vehicle Company, with the sensation of the show in a 500-pound electric runabout having a battery weighing only 160 pounds.

Perhaps sufficient space has been devoted to the past to indicate something of the progress in development which will be disclosed at this year's display. Accompanying illustrations will still further demonstrate this point with special reference to the show itself.

The show committee has termed the setting for Madison Square Garden, "The Crystal Palace," because many thousand square feet of mirrors are to be used on all sides of the building. The arch girders spanning the ceiling will be hidden by a "sky" of blue material, soft and fluffy. The galleries will be extended into the amphitheatre some 20 feet and supported by steel girders, and the temporary floors will be a network of steel covered with wood. More than 200 tons of metal and 1,000,000 feet of lumber have entered into this construction. Ornate lamp posts will mark the various exhibition spaces and lattice work will predominate in the structural treatment. Three mammoth crystal chandeliers and about 30 smaller ones, of rich design, will hang from the dome, while along the railings and balconies garlands of flowers and vines will twine in profusion. Allegorical statues also will find a place in the general scheme, and as a whole the effect will be that of great spaciousness.

In the Grand Central Palace, which is a most magnificent building in its usual dress, new panels depicting scenes of famous motoring spots, such as the Delaware Water Gap, the Berkshires, along the Hudson, West Point, etc., will be installed. The mezzanine floor will be bordered by western views, including the Grand Canon of Colorado, Rocky mountain passes and ravines, California vistas and others of a similar character. Floral decorations will be added as well. The show committee has named this portion of the exhibition "The Palace of Versailles."

Succeeding pages will disclose many of the features which will attract and hold the attention of the visitors, and it only seems necessary to add that nearly all of the leading manufacturers of pleasure and business vehicles will be represented, as well as most of the prominent producers of accessories, supplies and fittings. In every respect the big double show will be representative of the entire industry. This applies as well to the commercial vehicle period as to the first week,

Suggesting Interior Treatment of Madison Square Garden for 13th National Automobile Show.

since many of the accessary exhibitors will remain throughout the entire show, those who make goods for commercial cars only taking

Digitized by Google

larger space for that display. The addition of the machine tool section will prove of special interest to present and prospective motor truck owners.

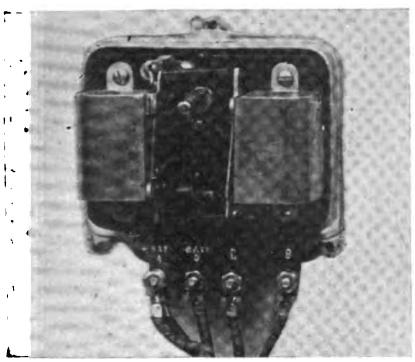
A large number of new cars and trucks have been announced or will be disclosed during the progress of the show. Practically all of the makers will produce models of pleasure cars which will be changed more or less by the addition of refinements in construction and conveniences in equipment. Electric lighting was a prominent feature last year, and several manufacturers entered the field with the motor starter. One of the features of the forthcoming show will be the large number of vehicles fitted with combined electric lighting and starting units.

Much has been heard relative to the six-cylinder engine, and while several new models of this type are introduced by concerns heretofore devoting their energy to the production of four-cylinder cars, it also is true that some six-cylinder makers have brought out new four-cylinder machines. The Knight motor will have some new adherents, and it is possible that other non-poppet valve designs may make their appearance at this time. Wire wheels also will prove an innovation with a number of makers.

Demonstration Hill on Roof of Madison Square Garden During First National Automobile Show in 1900.

During the second week several new trucks and light delivery wagons will be revealed. With some of these there has not been the same opportunity to secure information in advance that has prevailed with reference to the pleasure cars. It is certain that the worm drive will have some new adherents, and that this construction will appear on a number of the lighter vehicles. Many of the concerns which may be regarded as new in the industry are said to have been devoting time to experimentation covering long periods, and the product is regarded as having been subjected to every test which would be obtained in actual service.

Every effort will be made to permit full inspection of the display. This holds true of both the pleasure cars and trucks. One admission fee will admit to both buildings, the management having devised a ticket system which is expected to meet the approval of the visitors. Insofar as the commercial vehicle section is concerned, it may be stated that a special committee has issued personal invitations to hundreds of business men in all lines of activity, municipal officials and others at all likely to be interested, to attend the show and become thoroughly informed concerning the different types of vehicles on exhibit. This is a plan which has been carried out with decided success in connection with the Chicago show for two years, and was given its initial test in New York a year ago. Because a large percentage of the leading manufacturers will make display this year, in addition to the newer concerns, those desiring information relative to the merits of the respective products will have an excellent opportunity to make comparison.



In the accessory division there will be found much to attract and hold attention. Space does not permit of mentioning all of the new things that will be seen, even were it possible to give an entire list. Many manufacturers decline to announce their new products in advance. It may be expected that the fittings presented on the cars will be augmented by similar products at the accessory booths, and it is known that several makers are to present innovations, which have been given such tests as to indicate to them that they are thoroughly practicable in every respect. In view of the widespread interest in electric lighting and starting systems, it may not be surprising to learn that other electrical equipment has occupied the attention of designers, this being extended to numerous fittings not seen heretofore. Still another subject which has received marked consideration is that of protecting the car from theft. In every respect the accessory exhibit should prove quite as interesting as that of pleasure cars and trucks.

Motorcycle makers are much pleased because their products have been included in the display for the first week this year. It is contended by them that many people who are interested in motor cars also are anxious to learn of the possibilities of the two-wheeled mounts and sidecars, and that the best results are obtained when the two shows are united.

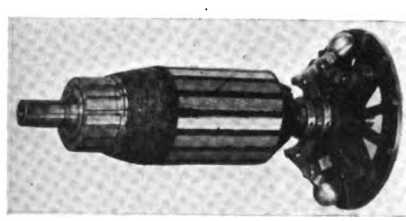
ELECTRIC LIGHTING SYSTEMS FOR 1913.

DYNAMO electric systems have become widely approved for motor car lighting.

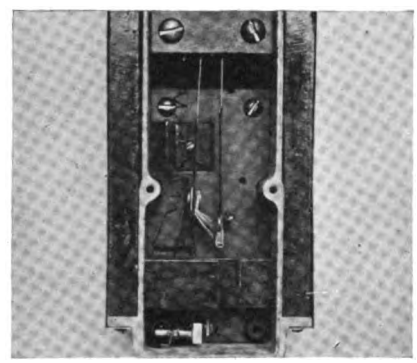


Automatic Control of Ward Leonard.

The advantages of electric lighting are obvious; simplicity, convenience of control, cleanliness, entire absence of smell, smoke, dirt and heat, are only a few. Beyond the initial outlay the cost is practically limited to the possible replacement of a few lamp bulbs during the year. The very general adoption of electric lighting by car manufacturers as standard equipment for 1913, and the successful application during the past year, demonstrate that the electrical engineer has solved the problem of regulating the current supply, and within fairly close limits.

The mechanical generator of the ordinary type supplies current at a pressure proportional to the speed at which its armature rotates, and when it is driven from the engine, which is a variable speed mechanism, the voltage varies from zero to the maximum. Ordinarily this fluctuation would result in great variations in the illumination given by the lamps, an undesirable factor, and one tending to destroy the filaments at excessive speeds.

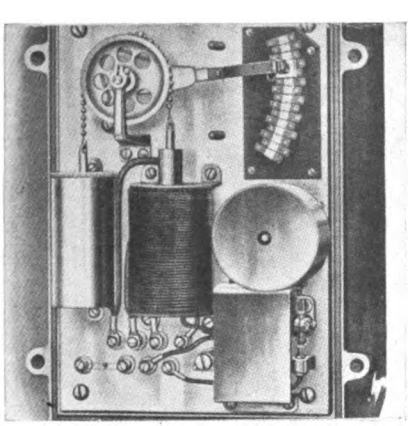
The regulation of the output of the dynamo may be classified as follows: Mechanical, operating upon the armature of the dynamo, causing it to clutch or declutch; electrical, or counter electromotive force being introduced into the field circuit, and



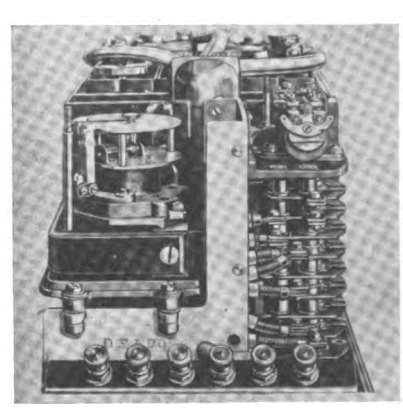
Mechanical Governor of Hartford.

electro-mechanical. The latter may be defined as an electrically operated resistance.

Another important factor is the cut-out, which automatically disconnects the generator from the battery or lamps when the output of the dynamo is below a proper charging value, or pressure for lighting the bulbs, at which time the battery is utilized, and when the motor is inoperative. The device also prevents the discharge of the cells through the dynamo when the voltage of the cells is greater than that generated by the dynamo.



Lighting dynamos or systems may be divided into two groups, those in which the battery is floated upon the line and those in which it is utilized as an auxiliary. With the former

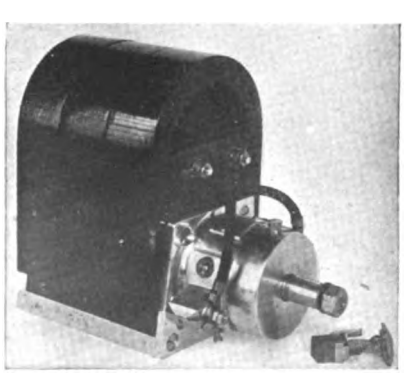


Electrical Control of Berdon.

system the current from the lamps is drawn at all times from the battery, which is maintained in a properly charged condition by the generator. The second type employs the dynamo for lighting the lamps, the battery being in reserve for service when the voltage of the generator falls below a predetermined value.

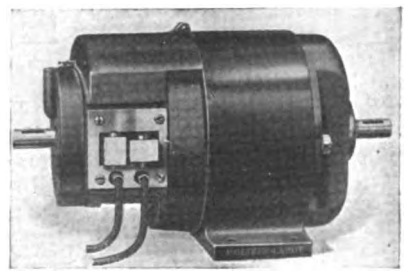
Various systems are presented and illustrated herein and the devices utilized for overcoming the variable speed of the motor car as well as for cutting in or out the current from the dynamo are also discussed in the following pages.

Adlake-Newbold Regulator.



Delco Control and Cut-Out Relay.

Digitized by Google



BERDON SYSTEM.

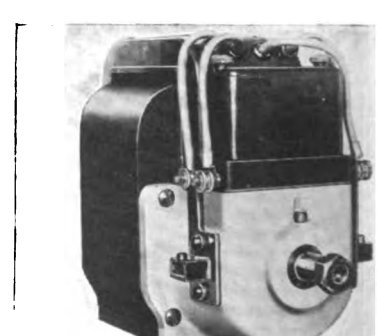
Output Is Proportional to Light Used.

With the Berdon Matchless system, manufactured by the Esterline Company, Lafayette, Ind., the battery is an auxiliary, current being supplied to the lamps by the generator, the output of which is proportional to the light used. It operates at slow speed and automatic regulation of the current is obtained by using a permanent magnetic field superimposed upon an electro-magnetic field. At slow speeds the permanent magnetic field and the electro-magnetic field operate together in developing a charging voltage. If the current is being delivered to the battery only, the electro-magnetic field is inoperative, but as soon as the lights are turned on the field of the permanent magnets is aided by the electro-magnetic field. A unique controller is utilized for connecting the battery to the generator when a proper charging value is developed, for limiting the current at high car speeds, and to disconnect the battery whenever the voltage of the dynamo is less than that of the battery. The generator delivers current to the lamps at a car speed of about five miles an hour, and proportionately at higher ratios.

Berdon Matchless Generator.

The Holtzer-Cabot Lighting Dynamo.

HOLTZER-CABOT.



Self-Regulating with Battery Floated on Line.

In the Holtzer-Cabot system, made by the Holtzer-Cabot Electric Company, Brookline, Mass., the battery is floated upon the line and maintained in a properly charged condition at all times by the dynamo. The output of the latter is electrically regulated by the construction of the pole shoes, without extra windings of any kind, and the current generated at high speeds is controlled by self-induction. The dynamo may be operated in either direction without regard to polarity. A feature of the generator is the automatic switch, which cuts in or out the battery when the speed of the dynamo falls below a stated number of revolutions. It operates on the centrifugal principle, is simple and requires no attention. The device is fitted to the armature shaft and when the latter attains a predetermined speed, proper contact is made, connecting the generator to the battery. Similarly the connection is broken when the speed falls again. It is held that the simplicity of the switch member and its special operating spring is such that it is positive. Compactness, high grade material and efficiency are employed. A feature of the Holtzer-Cabot system is its simplicity and ease of installation.

REMY DYNAMO.

Reverse Current Relay Is a Feature.

A reverse current relay is utilized in the Remy model M lighting dynamo, manufactured by the Remy Electric Company, Anderson, Ind., for preventing the discharge of the battery through the generator when the voltage of the cells is greater than that of the dynamo. It is an electrical device, making and breaking contact when the dynamo speed is over or below 250 revolutions a minute, and the current flowing in a reverse direction through a winding opposes a similar member. The generator is differentially compound wound, positively driven at crankshaft speed and the field is of the two-pole type. The reverse current relay is enclosed directly over the commutator. The dynamo operates at twice the voltage of the lamps, or about 13 volts, and the maximum current generated at 3000 revolutions a minute is five amperes at 12 volts. The generator develops more current with the lamps on than during the daytime because only a portion of the series field is used when the lamps are turned on. A 12-volt, 35-45 ampere-hour battery is employed. The Remy dynamo is compact and high grade material is utilized throughout.

Remy Model M Lighting Dynamo.

Digitized by Google

FISHER DYNAMO.

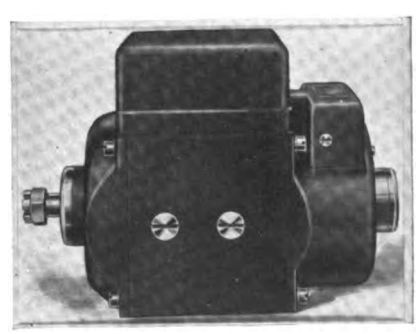
It Utilizes Self-Regulation Principle.

The construction of the Fisher lighting dynamo, made by the Fisher Electrical Works, Detroit, is such that the field builds up very rapidly until the maximum output of six amperes is attained at about 950 revolutions a minute. Higher speeds are taken care of by the self-regulating principle of the design, and it is held by the maker that the output is constant even at 2000 revolutions a minute. The dynamo is driven at crankshaft speed. The automatic cut-out, for disconnecting the battery to prevent discharge of the cells through the generator and for closing the circuit, is incorporated in a housing mounted over the brushes, and comprises a single electro-magnet. When the current developed by the generator is of proper value to charge the cells, the magnetism of the coil is sufficient to attract its armature, closing the circuit. When the pressure falls below the predetermined value the armature returns to its normal position, breaking connections between the generator and battery, at which time the cells supply current for lighting and when the motor is inoperative. The maximum output of the Fisher generator when charging the storage battery is approximately eight amperes.

Fisher Lighting Generator.

Hartford Dynamo Is Very Compact.

HARTFORD DYNAMO.



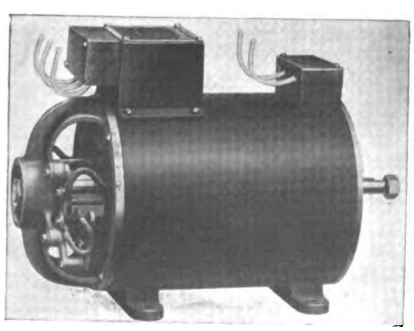
Car Speeds Compensated for by Governor.

One of the qualities of the Hartford lighting dynamo, made by the Hartford Suspension Company, Jersey City, N. J., is its compactness. It delivers a steady voltage irrespective of motor car speeds, charging the battery which is floated upon the line. The variable speeds of the automobile are compensated for by a centrifugally operated governor, simple in design, which makes and breaks contact between the driving and driven disc. When the speed of the generator rises above a certain number of revolutions, contact is broken gradually, the driven pulley continuing to revolve at speed, but that of the armature is held practically steady. The governor operates at a car speed of about 14 miles an hour. The generator is of the permanent magnet type having auxiliary electro-magnetic fields. The latter are wound around the pole shoe extension instead of the permanent magnetic field. The generator is cut in to the battery when the car is travelling at about eight miles an hour and is not disconnected until the speed falls to approximately six miles an hour. A magnetic cut-out is utilized, it comprising an iron clad coil with series neutralizing the coil. The volt chart shows very close regulation of the generator. A 12-volt, 60 ampere-hour battery is used.

DYNETO SYSTEM.

Dynamo Operates at Slow Car Speeds.

The Dyneto lighting dynamo, made by the Dyneto Electric Company, Syracuse, N. Y., is a slow speed, compact automatic generator utilizing an automatic switch for connecting and disconnecting it to the storage battery, and a current regulator and governor to adapt the output to the requirements of the cells regardless of motor car speeds. It operates at crankshaft speed, about 500 revolutions a minute, or a car speed of 15 miles an hour. At this ratio the automatic switch closes the circuit to the battery, a six-volt member, and it is held that the charging rate will be according to the condition of the cells. If the lights are being burned the governor will automatically increase the current generated to meet requirements without drawing upon the battery. When the car speed falls below a proper generating value the automatic switch opens, disconnecting the dynamo and preventing discharge of the battery, which then supplies current to the lamps. A switch meter unit is part of the equipment. The Dyneto is very compact, weighs but 19 pounds and qualities emphasized are: Accessibility of governor and switch, high grade material and workmanship.



Dyneto Automatic Dynamo.

RUSHMORE DYNAMO.

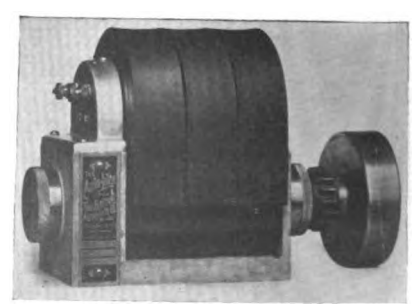
Regulation Is by Novel Coil Member.

A constant current for charging the battery, which is floated upon the line, is one of the features of the Rushmore dynamo, manufactured by the Rushmore Dynamo Works, Plainfield, N. J. The regulation of the dynamo is by a shunt field coil with which is connected a balance coil, so that the former receives current at all times at the constant voltage of the battery, and another winding is added to the field. This is termed a bucking coil, so constructed as to oppose the shunt field coil. The resistance of the bucking coil is greater than that of the ballast resistor when the latter is cold or slightly heated. When the resistor becomes heated with current its increased resistance forces the bulk of the current delivered by the dynamo to pass through the bucking coil, thereby augmenting the counter excitation produced by the latter. As the strength of the magnetic field is due to the difference between the exciting effect of the main shunt field winding and the bucking coil, by suitably proportioning the latter and the ballast coil to the other elements, the variation in the current may be as small as desired. Below 200 revolutions a minute the dynamo is cut out.

Rushmore Dynamo Is Self-Regulating.

Aplco Dynamo-Motor Starter.

APLCO SYSTEM.



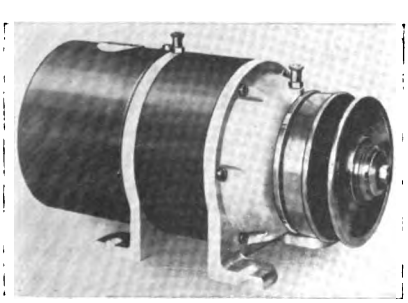
Combination Unit for Lights and Starter.

The Aplco dynamo-motor starter, manufactured by the Apple Electric Company, Dayton, O., is a combination lighting and motor starting equipment. When the machine operates as a dynamo it not only charges the battery, but supplies current for ignition, the cells furnishing current when the speed of the motor car falls below a predetermined rate and when inoperative. The battery is employed to energize the motor for starting the engine, for which operation the cells are connected in series to provide the proper voltage. During the starting process the ignition circuit is automatically switched on and upon the engine starting under its own power the controller cuts out the electric motor and rearranges the cells for charging. The current flows through a regulator to the battery as well as various circuits of the system. The regulator comprises a series of carbon discs, held in contact by a spring, and the pressure is magnetically controlled; that is, resistance is inserted in the field circuit, cutting down the field exciting current. An automatic cut-out is incorporated in the regulator panel, which connects the dynamo to the cells when a sufficient voltage is developed by the generator for charging.

AUTO-LITER.

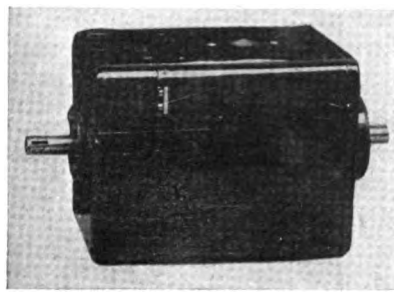
Control and Regulation Are Automatic.

Current for the lamps is supplied by the generator at car speeds of 10 miles and above in the system manufactured by the Electric Auto-Lite Company, Toledo, O. The Auto-Liter is a compact machine having an automatic electrical device located under the magnets for disconnecting the battery from the dynamo when the charging current is not of proper value, and similarly for breaking the circuit. The variable speed of the automobile is compensated for by an automatic control of the centrifugal governor type, also incorporated in the generator. At car speeds of 18 to 20 miles an hour the Auto-Liter attains its maximum output of 10 amperes, remaining at this amperage regardless of higher speeds. Below 10 miles an hour car speed and when the dynamo is inoperative, current is supplied by the storage battery, which is an LBA six-volt, 80-120 ampere-hour capacity member. The excess current above that consumed by the lamps is led to the cells, and during the daytime the generator is charging the battery. An ammeter is a part of the equipment and being mounted upon the dash enables the driver to note at all times the operation of the system. The wiring plan is very simple.



Auto-Liter with Automatic Control.

Digitized by Google



DYNALUX DYNAMO.

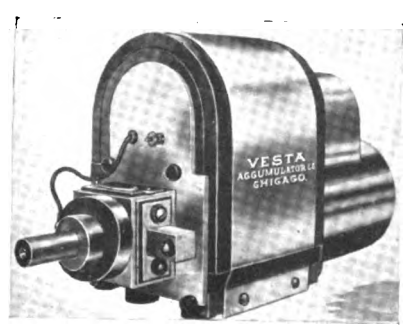
Uses Declutching Device for High Speeds.

In the Dynalux lighting system, made by the Dean Electric Company, Elyria, O., current for the lamps is drawn from the storage battery which is maintained in a properly charged condition by the generator. The latter is self-regulating, of the two-pole type, and the field windings are of the differential-compound design. For preventing high or excessive ratios a declutching device is employed, comprising a star shaped spring carrying light and heavy weights and being in contact with a friction disc mounted upon the armature shaft. An automatic cut-in device is utilized for connecting and disconnecting the generator with the battery when the proper charging current is developed or when it falls below the proper value. It operates upon the centrifugal principle, a flat steel spring, attached at one end to a disc keyed to the armature shaft, having a weight on its free end, which swings to the left when centrifugal force reaches a point where it is sufficiently powerful to overcome its tension. A pair of contact members open and close the circuit at predetermined speeds. The current from the battery may be utilized for ignition, if desired. The wiring plan is very simple.

Dynalux Uses a Declutching Device.

Ward Leonard Automatic Dynamo.

WARD LEONARD.



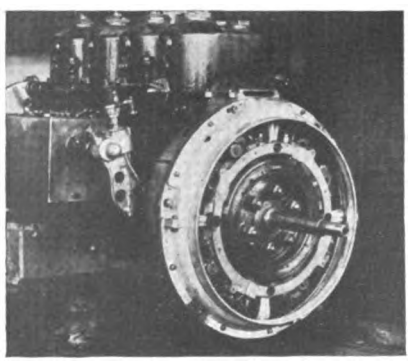
Is Electrically Controlled and Compact.

A compact, plain, shunt wound dynamo, an automatic controller and a combination switch and distribution panel are features of the Ward Leonard automatic dynamo, made by the Ward Leonard Electric Company, Bronxville, N. Y. An electrically operated switch located in the automatic controller permits of charging the battery when the generator develops a proper voltage and disconnects the dynamo when it falls, preventing discharge of the cells through the machine. Excessive or high car speeds are cared for by an automatic controller which inserts a single step of resistance in the dynamo field, reducing its ampere output to a predetermined amount. When the speed of the motor car falls or equals this amount, the resistance is automatically cut out. The dynamo develops a current of proper charging value at all car speeds above 10 miles an hour. When the generator is inoperative or its armature is driven at any speed up to that corresponding to 10 miles an hour, the current is supplied by the battery. Three types of dynamos are produced, each having an output of 10 amperes. A six-volt, 80 ampere-hour capacity LBA battery is utilized in this system.

VESTA DYNAMO.

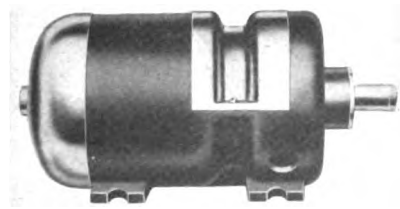
Rheostat Arm Feature of System.

The speed of the Vesta generator, manufactured by the Vesta Accumulator Company, Chicago, is mechanically controlled and the battery is floated upon the line. Two weighted arms on the armature shaft operate inwardly or outwardly, depending upon centrifugal force. Pivotally connected to a loose pulley on the armature shaft is a lever termed the contact arm having two points in contact with a form of rheostat. The arm moves backward and forward, actuated by the loose pulley. Two springs also are utilized to counteract the centrifugal force against the weighted arms. One spring governs the time at which the circuit is made and broken and the other the amount of resistance inserted in the circuit at the varying speeds. The rheostat arm prevents the flowing of current to the battery until a predetermined speed is reached, cutting in the current at about one ampere and gradually increasing the amount until six amperes is attained in the type 6 generator. The current is held constant at this point by means of the governor, which automatically inserts such resistance in the circuit as is necessary to maintain the proper charging value at all times.



Vesta Magneto Generator.

Digitized by Google



U. S. L. SYSTEM.

Combined Unit Replacing Flywheel.

The United States motor-generator, made by the United States Light & Heating Company, New York City, is a combination unit in that it is employed for lighting, starting the motor and for ignition. It has but one moving part, the armature, this replacing and performing the function of the flywheel of the engine. The armature is bolted directly to the engine shaft flange while the field or stationary part is secured to the crankcase concentric with the engine shaft. This construction eliminates gears, sprockets, etc., making for noiseless operation as well as economizing space. A regulator, mounted upon the battery box or in any other convenient place, controls the output of the generator, which maintains the battery in a properly charged condition. Current for starting is supplied by a storage battery, the engine shaft being rotated by pressing a button, the release of which automatically disconnects the current and the generator begins to charge the battery when a proper voltage is developed. The design is capable of modification for installation and to accommodate any clutch. High efficiency is emphasized in this system.

U. S. L. Motor-Generator.

Gray & Davis Lighting Dynamo.

GRAY & DAVIS.

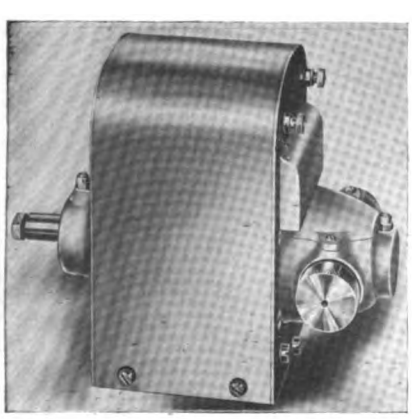
Clutch and Governor Control Dynamo Speed.

With the Gray & Davis constant speed dynamo, manufactured by Gray & Davis, Inc., Boston, the battery is utilized as an auxiliary, and through an arrangement of the switch connections the generator operates as a shunt wound machine when charging the battery and as a compound wound dynamo when supplying the lamps directly. The variable speeds of the motor car are taken care of by a friction clutch and governor, the latter being of the centrifugal type and controlling the pressure of the contacting plates. With the generator operating at a speed of 1200 revolutions a minute there is no slipping, but when the speed of the motor exceeds this, the governor weights come into action, causing one disc to move more or less out of contact with the other member. The plates are held in contact by a spring. An automatic electric cut-out is utilized to cut in the current to the battery when the generator develops a proper charging voltage, and to break the connection when the pressure falls below that of the battery. This action is secured through an electro-magnet having a compound winding, the fine wire part of which is connected across the dynamo terminals. A six-volt, 80 ampere-hour capacity battery is employed with this system.

SPLITDORFLITE.

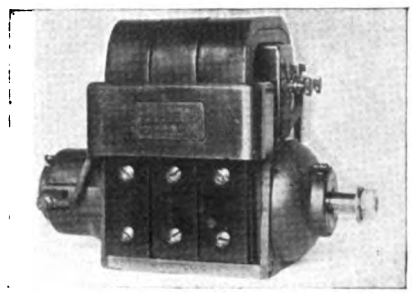
Control Is by Windings and Field.

The battery is floated upon the line in the Splitdorf lighting generator, manufactured by the Splitdorf Electrical Company, Newark, N. J. It differs from those of usual construction in the method of compensating for the variable speeds of the motor car. Control is accomplished by the differential windings and a special construction in the arch of the generator, it being maintained that the output is held above a predetermined speed to a uniform quantity and that the battery is charged properly. The magnetic field is strengthened by the addition of electro-magnetic compound wound fields, and situated within the arch of the cover is an electro-magnetic device which automatically connects and disconnects the generator with the lighting circuit. When the armature rotates at a low rate of speed the magnetic field provided by the permanent magnets builds up the auxiliary field produced by the passage of the current through the shunt winding of the compound wound electro-magnets. When the field attains sufficient strength the regulator contact closes, connecting the battery.



Splitdorf Generator.

Digitized by Google



WELLS DYNAMO.

Control of Output Is by a Magnetic Shunt.

In the Wells system, made by the R. C. Wells Manufacturing Company, Fond Du Lac, Wis., the battery is used as an auxiliary, current being supplied to the lamps by the generator, which is bipolar of the shunt wound type. Control of the output is by a magnetic shunt which holds the current at a proper value and this automatic regulation compensates for the variable speed of the car, be it a few miles an hour or the maximum. It is also held by the maker that the proper charging rate is assured and that the battery will always be in a serviceable condition irrespective of day or night running. An automatic magnetic switch is utilized for opening and closing the circuit between the generator and cells and at predetermined slow speeds. The dynamo is designed to operate at two to 2.5 times crankshaft speed, all parts are fully enclosed, and in event of injury to the battery will supply proper lighting current at car speeds of about 10 miles an hour. It is very compact and weighs 19.5 pounds. All parts are very accessible and high grade material is used.

Wells Lighting Generator.

Deaco Operates at Slow Speed.

DEACO DYNAMO.

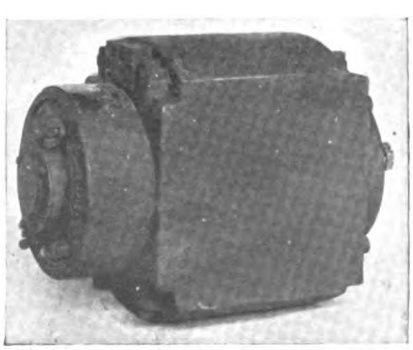
Has High Output at Low Car Speeds.

Two fields, a permanent magnetic and an electro-magnetic, are utilized in the Deaco generator manufactured by the Detroit Electric Appliance Company, Detroit. Three compound horseshoe magnets are employed and the auxiliary fields are mounted on these. The generator develops a high output at low speeds and all variations of car speed do not change the amperage of the current supplied to the battery which is floated upon the line. Regulation of current is through an automatic device over the armature, consisting of two electro-magnets operating two armatures which are pivoted and spring returned. Platinum contact points are utilized and the magnets are in series with the line, so that their pull varies as the current flows. At very slow speeds the permanent magnetic and electric fields are combined, these being of such polarity as to strengthen the permanent magnets. As speed increases the electric fields are cut out, the permanent magnets supplying the necessary magnetic flux. At higher speeds the regulator automatically reverses the electric fields, allowing a small current to flow through them. At excessive high ratios the permanent field is weakened. Two electro-magnetic coils comprise the cut-out.

ADLAKE SYSTEM.

Utilizes Novel Electric Regulator.

A feature of the Adlake system, made by the Adams & Westlake Company, Chicago, is the Adlake-Newbold regulator which electrically connects and disconnects the dynamo from the working circuit as required when the car is started or stopped and which also automatically maintains a constant voltage and current irrespective of the changes of speed of the car. The regulator has a solenoid which automatically varies a resistance connected in series with the dynamo field. A full capacity is claimed at low motor speeds and when current is supplied to the lamps by the dynamo, the battery being held in reserve without being charged or discharged. All current generated runs to the regulator, which maintains a proper electrical balance between the dynamo and lamps at night, and between the generator and battery in the daytime. A rheostat arm moves up and down freely, being actuated by the magnetic pull of an iron plunger in the solenoid, inserting a proper resistance. The device is adjustable and the system makes provision for ignition if desired. All working parts are easily accessible.



Adlake Engine Speed Dynamo.

WAGNER DYNAMO.

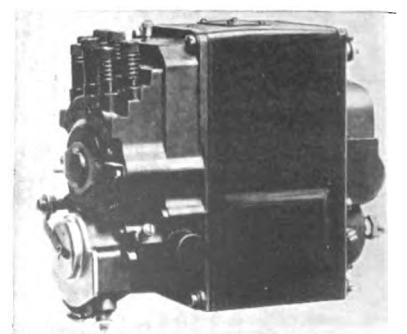
Generates Lighting Current at Slow Speeds.

The Wagner lighting dynamo, made by the Wagner Electric Manufacturing Company, St. Louis, Mo., is self-regulating and its main field is of the well known shunt type. It is held that the output is constant at speeds ranging from 400 to 3250 revolutions a minute of the armature shaft and that current is supplied at car speeds of about six miles an hour. An electrically operated automatic switch is utilized to close the circuit between the generator and the battery when the former develops the proper charging value and to open the circuit when the voltage falls below that of the cells. Two coils are employed, one being in shunt across the terminals of the generator and the other connected in series. The second coil includes a pair of contracting arms the pressure of which is augmented when the current flows from the dynamo to the battery. When the voltage of the generator is less than that of the cells, the contacting arms separate, breaking the circuit. The battery is utilized as an auxiliary and is manufactured by the company. The output of the dynamo is held approximately under eight volts at high motor car speeds.

Wagner Self-Regulating Dynamo.

Perfection Lighting Generator.

PERFECTION.



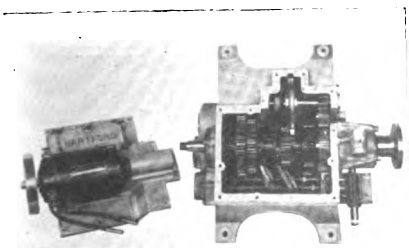
Magneto Type for Charging the Battery.

In the Perfection lighting equipment, made by the Economy Manufacturing Company, Economy, Penn., the generator is of the magneto type with the magnets of the permanent horseshoe design. It is a simple machine in that the maker points out that it is constructed without insulated screws or bushings and that the insulated portion of the generator is separate and apart from the balance of the construction, being mounted upon a single, insulated ring. The base plate of the machine is a non-conducting composition. The self-regulating features are through a special construction of the armature and it is held to develop about eight amperes at 1500 revolutions a minute. The automatic cut-out is of the mechanical type, is very compact and may be installed under the hood or on the dash. It is sealed to prevent tampering and its function is to prevent the discharge of the battery through the generator when the latter is inoperative or not developing the proper charging current. Under the last named condition the cut-out is open, but upon the generator attaining a predetermined speed the cut-out closes, establishing connections between the generator and the battery. This cutting in of the current is performed automatically.

WESTINGHOUSE.

Dynamo Lights Lamps; Battery an Auxiliary.

In the Westinghouse low speed, combined lighting and ignition generator, made by the Westinghouse Electric & Manufacturing Company, East Pittsburg, Penn., the output is automatically regulated and the battery employed as an auxiliary. Permanent magnets are dispensed with and the operation of the cut-out switch is such that it is not used continuously. The cells are charged automatically and a regulating feature is secured by connecting the battery through a reversed compound field winding of the generator. Current for the lights does not pass through this winding, however, and when the lamps are turned on the output of the generator automatically increases to supply them. At low speeds the cells furnish a certain proportion of the current, and when the motor is inoperative. The battery is charged when the generator is operating without lights in the daytime, and at moderately high speeds at night with the lamps burning. The generator is driven at crankshaft speed for four-cylinder motors, and by an Oldham coupling, facilitating installation and quiet operation. Several types are produced and all parts are enclosed.



Westinghouse Lighting Generator.

STARTING THE MOTOR CAR BY ELECTRICITY.

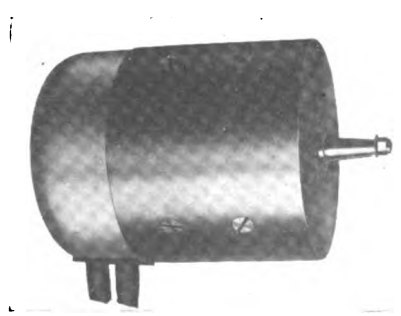
The Efficiency and Utility of Electric Motor Starters, Operated from the Seat and Sometimes in Combination with Dynamos, Have Been Recognized by the Industry.

DURING the past year the development of the electric motor starter has been very rapid. This labor saving and safety device is being adopted by many car makers and fitted as standard equipment for 1913. When it is considered that an ordinary 4.5-inch bore and 5.5-inch stroke motor requires about one pound torque at a one-foot radius to crank it at 60 revolutions a minute, and that the torque of an electric motor is greatly in excess of this, some idea may be obtained of the remarkable energy developed by these compact electrically operated motors. In addition to being capable of rotating the crankshaft of the engine by merely pressing a button, or moving a pedal or lever, the starter is able to operate the car for a considerable distance, depending upon the capacity of the battery. Although the energy is usually applied to the flywheel of the engine, the starter may be fitted to the layshaft of the transmission, etc. Some starters are in combination with the lighting dynamo as will be noted in the systems which are described and illustrated herein.

Hartford Applied to Transmission.

Hartford Motor Starter.

HARTFORD.



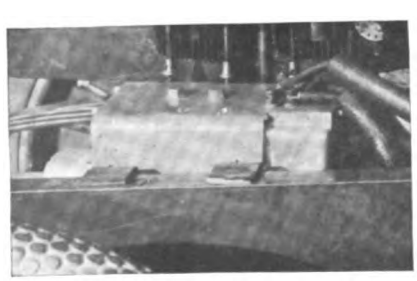
Constant Mesh Gears Used for Starting.

Compactness and a high efficiency are among the qualities of the Hartford motor starter, made by the Hartford Suspension Company, Jersey City, N. J. It is operated at high speed by a 12-volt battery and through a gear reduction totalling 125 to one, the gears always being in mesh. Energy is transmitted through a worm drive and spur gears, one of which is fitted with a positive roller clutch, which engages in starting and automatically disengages when the explosive motor takes up its functions. The worm gear is not keyed to the motor shaft, but is secured through a friction disc and spider spring, similar to the member utilized on the Truffault-Hartford shock absorber. The function of the device is to dissipate the force of a back kick of the gasoline motor. The gears that are always in mesh are stationary when the car is running under its own power. The Hartford starter is operated by a button, may be fitted to the transmission shaft, clutch shaft or crankshaft in front and may be installed as a separate unit or in combination with the dynamo. All parts are constructed of high grade material and are accurately machined. Small consumption of current is emphasized.

GRAY & DAVIS.

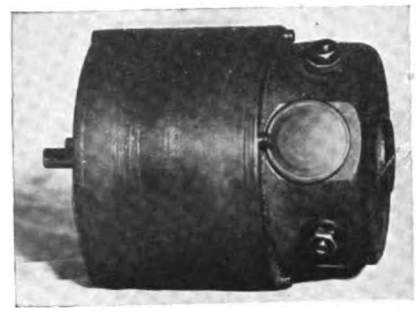
Operates at Six Volts at High Efficiency.

Features of the electric motor starter manufactured by Gray & Davis, Inc., Boston, are: Compactness and high efficiency, that it is operated by a six-volt battery and that the latter is utilized in conjunction with the lighting dynamo made by this company. The starter is easily operated, the pressing of a pedal energizing the motor, which actuates a gear meshing with teeth cut upon the periphery of the flywheel of the explosive engine. Upon the latter starting the electric motor automatically ceases to operate. The maker points out that its high efficiency has been demonstrated in severe tests, that it will rotate the crankshaft of a large six-cylinder motor for over 90 minutes and that a car may be propelled over two miles, also that it will drive a machine up a 7 per cent. grade on the second speed. It is held that it will start the car upon the high gear with the clutch engaged and that it is economical of current. Each motor is thoroughly tested up to a 200 per cent. overload and high grade material and workmanship are also emphasized. It may be mounted as best to suit convenience and is very compact.



Gray & Davis Motor Starter.

Digitized by Google



ENTZ STARTER.

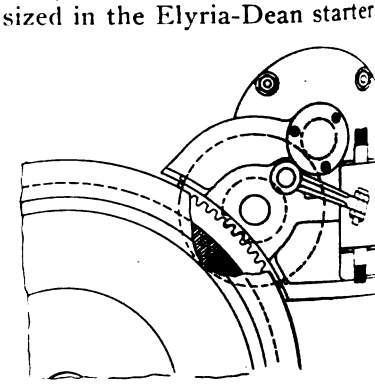
Also Operates Motor at Slow Car Speeds.

The Entz combined motor starter and lighting generator, made by the H. H. Franklin Manufacturing Company, Syracuse, N. Y., presents interesting features in that the generator unit is so constructed that it operates as a motor at low car speeds and without attention of the driver after the starting switch has been thrown on. At low car speeds current is drawn from the battery, but as the engine speed increases to approximately 300 revolutions a minute a counter electromotive force, generated by the augmented speed of the armature in the magnetic fields, changes the direction of the flow of current, so that the motor becomes a generator charging the battery. A double-throw, knife blade, three point switch is utilized and is mounted on the dash. When the handle is in the lower position the magneto is short circuited and the engine cannot be started. The lever may be locked in this position. Another position permits of setting into operation the motor starter as well as the magneto, and the intermediate is employed for breaking the starter circuit. One of the qualities emphasized of the starter is that it operates the motor when it tends to stop, a convenient factor in traffic. An LBA 18-volt battery is utilized.

Entz Combination Unit.

Esterline Motor Starter.

ESTERLINE.



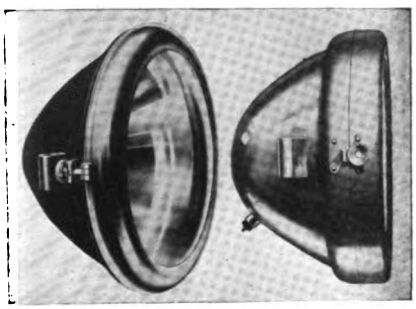
Separate Unit Type with Enclosed Gears.

The Esterline Company, Lafayette, Ind., maker of the Berdon Matchless lighting system, has brought out an electric motor starter of the separate unit type, arranged for gearing either to the flywheel, or to the crankshaft by means of a sliding chain drive. The motor is provided with a suitable gear reduction which provides the proper ratio on the back shaft for obtaining the desired speed or rotation of the crankshaft. It operates at six volts and it is held that it will spin the largest six-cylinder engine at speeds varying from 70 to 90 revolutions a minute. The entire weight of the unit is 40 pounds. All parts are fully enclosed and accessible. The gears are of the double herringbone Weiss type, of high carbon steel, and the pinion is bronze. It is held that the construction not only makes for quiet operation, but that the gears are capable of being run dry. The gearbox is made separate from the motor bell end, but is self-aligning and is secured through six large screws. The starter is operated by a push button on the dash which cuts in the current and automatically operates the switch mechanism, throwing the gears into mesh. The battery utilized is a six-volt 120 ampere-hour member.

ELYRIA-DEAN.

Made in Two Sizes Having Clutch Device.

The Elyria-Dean motor starter, made by the Dean Electric Company, Elyria, O., is produced in two sizes, one six inches in diameter for engines up to and including 30 horsepower and the other, 7.25 inches and capable of cranking all motors. Both are operated from a six-volt battery, a simple one-way pole switch being utilized, and drive is through a reduction gear to the flywheel or crankshaft. The reduction varies according to the construction, etc., and it may be as high as 35 to one or as low as 20 to 1. The smaller starter rotates the crankshaft of the engine between 80 and 100 revolutions a minute on 75 to 100 amperes with a battery voltage of 5.2. The gearing utilized is very simple and an over-running clutch is fitted, so that the engine may be speeded without danger to the mechanism. The starter may be operated by push button or a lever and the actuating mechanism is not in service except when starting the motor. The wiring is especially heavy and the switch has a large contact area, with a single step of resistance making for easy engagement of the gear. High efficiency with a minimum consumption of current is emphasized in the Elyria-Dean starter.



Elyria-Dean Motor Starter.

PROGRESS REVEALED IN ELECTRIC LAMPS.

MANUFACTURERS of electric lamps will present numerous new designs for 1913

Gray & Davis and Guide Headlights.

and while it may appear that the lights are similar to those utilized during the past year, improvements have been made, all tending toward greater efficiency and durability. The general adoption of electricity as an illuminant has resulted in the production of a variety of rich and artistic designs, those intended for service with the closed type of machine being particularly striking in appearance and finish.

Interest centres in the headlight, and while to some it would appear a simple matter to construct a practical lamp, the efficiency of which would depend upon the candlepower of the bulb, there are other factors to be considered. A large amount of light projected by the reflector does not necessarily make for efficiency. The function of the reflector is to collect as many of the rays emitted from the source of light as possible and project them forward; not necessarily in a parallel beam like a searchlight, but so as to obtain the best driving light. It is not sufficient for safe driving to illuminate a narrow strip of road with a powerful beam. All the light from the bulb should be collected and projected forward, and the central rays should gradually merge into a soft outer fringe, providing maximum range with minimum glare. Such a design makes for safety in rounding corners as the entire road is illuminated.

Solar Tail and Number Lighting Lamp.

Apico Headlight.

Reflectors may be divided into two groups—metal and glass. The former may be constructed from a casting turned accurately to a true parabola shape, spun from brass or shaped by specially constructed dies. When the first process is employed the reflectors are spun over a steel chuck the curve of which has been plotted carefully to obtain the most durable and efficient results, after which the surfaces are trued, buffed and polished. Following this operation a heavy plating of nickel is placed upon the shell and given a high polish, supplying the foundation for the silver plating process. This is important, requiring the best of workmanship and material. After silvering, the surface is again polished to a high degree of brilliancy and placed within the lamp. Types of metal lamps are indicated by the Gray & Davis, Guide and Edmunds & Jones, shown in the accompanying illustrations.

Holt & Beebee Tail Light.

The glass type of reflector differs in that the material is molded, after which process the parabola is polished on the inside, ground to a true surface on the exterior and silvered before being placed within the shell. The Aplco Golden Glow headlight,

Cowles Tail Lamp.

Digitized by Google

Cowles Staver and Dome Lights.

made by the Apple Electric Company, Dayton, O., has a slightly yellow tint, which is held to make for greater penetrating qualities and to eliminate magnifying effects.

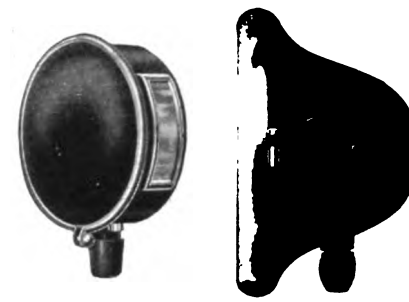
The Esterline Company, Lafayette, Ind., utilizes a glass reflector of a deep, green color, and it is maintained that a soft, yellow penetrating light, free from dazzling effect, is secured. The producers of the glass reflectors claim they make for great efficiency in that they do not tarnish and that they may be cleaned easily.

Particular attention is paid to making the lamp dust and moisture proof, and lightness and durability are also considered. Focussing devices are incorporated; important factors in that upon the location of the bulb depends the efficiency of the light.

The majority of headlights are fitted with locking devices to prevent opening the door and theft of the bulbs, a not uncommon occurrence. In the Gray & Davis lamps, made by Gray & Davis, Inc., Boston, a substantial screw is fitted over the bar of the door fastener and cannot be removed without a screw driver. In the Aplco design metal fingers draw the door back snugly against the body of the lamp and the door is locked by a mechanism operated by a removable key. Similar devices are utilized by other makers.

The manufacturer is paying considerable attention to the connectors or sockets connecting the lamp with the source of current. The Esterline Company utilizes a unique arrangement in that the leading-in wires pass through the supporting bracket in the side lamp, protecting the connection and bringing the terminal nearer to the body of the car. The Edmunds & Jones Manufacturing Company, Detroit, makes use of a patented socket the main feature of which is to eliminate opportunity for short circuits.

Many artistic designs of side lamps are noticeable, conforming to that of the head members, and in the majority of instances these are strictly electrical units, dispensing with the oil burner.



Cowles Limousine Lamps.

A wide variety of tail lamps will be seen at the shows on 1913 models. One of the latest is the design made by the Esterline Company. It differs from conventional practise in that it is a solid glass molding; that is, the body is spherical and constructed of genuine ruby glass. A window of white glass is incorporated for illuminating the license number. It is termed the "All-Round Ruby" and the only metal employed is the socket and mounting attachment.

Holt & Beebee Landaulet Lamp.

Edmunds & Jones Tail and Headlight.

Other tail lights of high grade construction are those manufactured by Holt & Beebee, Boston, and the Edmunds & Jones Manufacturing Company. The Badger Brass Manufacturing Company, Kenosha, Wis., maker of Solar lamps, will present a number of lighting lamps having practical features. An artistic design of tail light will be noted in the Cowles, made by C. Cowles & Co., New Haven, Conn. It is of the square, pillar type with heavy plate glass windows.

There are a large number of artistic designs for the closed car, both for interior and exterior illumination. Particularly striking are the Cowles limousine light, and those manufactured by Gray & Davis and Holt & Beebee. These are heavily silved plated and enamelled, and their appearance is heightened by the heavy plate glass utilized. A number of lights making for convenience and comfort are now standard equipment.

In addition to the types mentioned and illustrated herein there will be displayed at the shows a number of other designs fully in keeping with those which are making their appearance on the 1913 automobile.

Cowles Corner Light.

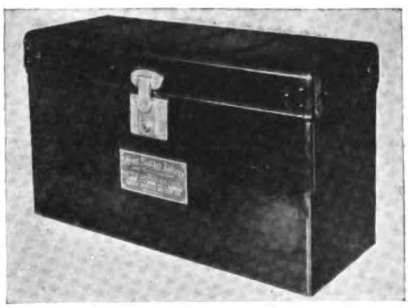
Digitized by Google

LIGHTING AND MOTOR STARTING BATTERIES.

STORAGE batteries utilized for lighting and starting are designed to withstand successfully the hard service required of them in automobile work. Unlike the ignition member they have a high capacity and discharge rate and it is interesting to note that the manufacturer has combined the essential qualities in a very compact manner.

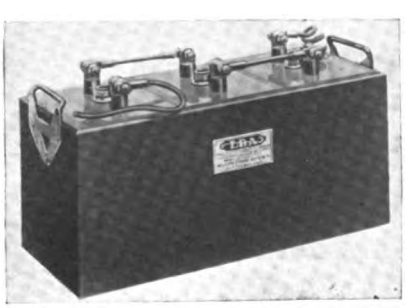
LBA Class B Starting Battery.

The Willard Storage Battery Company, Cleveland, O., maker of the LBA lighting and motor starting batteries, manufactures a large number of types to meet the varied requirements of motor car service. Individual unit cells are employed with the Willard pasted type of plates which with the special alloy grid make for strength. Creeping of acid and subsequent corrosion are prevented by a special rubber device, and an expansion chamber cares for changes in the volume of the solution during charge and discharge. Non-corroding terminals and handles and semi-flexible rubber jars are features, and a plastic sealing compound makes for rigidity and absorbs stresses. The cell units are contained within a chemically treated case with dovetail joints and the wood also is given several coats of acid proof paint. The handles of the batteries are provided with a hold down hook for retaining the battery in position after installation.



Philadelphia Storage.

A feature of the batteries manufactured by the Philadelphia Storage Battery Company, Philadelphia, is the utilization of thin plates, a construction making for compactness and minimum weight and one that the maker holds increases the ampere capacity. The batteries are made in a number of types, of different capacities, non-corrosive, and are fitted with neat handles facilitating installation and removal.



Geiszler Battery.

One of the qualities of the Geiszler non-sulphating battery, made by the Geiszler Bros. Storage Battery Company, New York City, lies in that it is guaranteed that it may be laid away for an indefinite period either in a charged or discharged condition without the slightest injury to the plates from sulphation. The batteries are of the sulphuric acid lead type and the maker holds that the special design of plate eliminates opportunity of buckling and sulphation even if the cells are neglected for months. The cells are designed to withstand severe service and are constructed in different sizes and capacities to meet requirements. The company has had an extended experience in the manufacture of storage batteries and guarantees its product.

Edison Nickel Iron Battery.

In the Edison nickel-iron battery, made by the Edison Storage Battery Company, Orange, N. J., the electrolyte consists of a 21 per cent. solution of potash in distilled water with a small per cent. of lithia, and it is held that the density of the electrolyte does not change on charge or discharge and that hydrometer readings are unnecessary. A quality emphasized of the Edison product is that the cells may be left indefinitely in a charged or discharged condition without injury. The batteries are made in different sizes and capacities to meet requirements.

LBA Class A Lighting Battery.

DASH CONTROLS AND INDICATING DEVICES.

Accessibility and Convenience of Operation from the Seat Have Led to the Utilization of the Dash—Methods Employed in Various Installations.

OBSERVING motorists will not fail to note that one of the features of the 1913 motor car is the growing tendency of the manufacturer to mount a large number of control and other accessories on the dash. The adoption of electricity as a means of illumination, and the motor starter, have been responsible largely for this step, although several other useful devices making for convenience in operation are included.

When the modern machine is compared with the early models it will be noted that the dash carries a greater number of accessories, but it may be stated that probably all of the present equipment would not occupy as much space as did the generator on the old automobile, and that the compactness of the present controls does not detract from the appearance. This statement is borne out by the accompanying illustrations which present this feature on several 1913 cars.

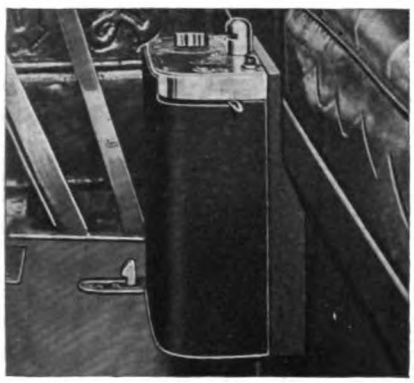
Until recently there was a marked tendency to eliminate from the dash all unnecessary

Compactness and Accessibility Are Features of the Pierce-Arrow.

Control Board of Packard Located on Steering Column Under the Wheel.

equipment, excluding therefrom all control devices with the exception of the ignition switch and the oil sight feed member. This was in decided contrast to the pioneer motoring days when the fittings included a large coil and switch, a cumbersome oiler and generator, and other appliances occupying considerable space. The improvement in lubrication methods was responsible for placing the oiler under the hood while the generator was mounted on the running board. With the general adoption of the magneto as a source of current the four and six-unit coil box gave way to a single, compact coil and in many designs this was placed on the dash under the hood. The advocates of the plain dash grew in numbers until it held but an ignition switch and the oil indicator.

The advent of the fore door, straight line body and cowl dash led the manufacturer to remove all accessories from the running board and this naturally meant the utilization of the dash for the fitting of a number of appliances formerly attached to the exterior of the car, the speedometer for example. Not only was the appearance of the machine enhanced by this arrangement, but the mounting of several accessories upon the dash not only protected them from the weather and possible damage, but brought them within plain view of the operator, making for convenience of control.



To the equipment comprising the ignition switch and oil sight feed has been added the speedometer, dash lamp, carburetor control, lighting and starting switches, pressure and oil gauge, voltmeter, ammeter, fuel gauge and other accessories making for convenience. That considerable ingenuity has been displayed in the designing and mounting of these devices will be noted by the methods utilized and described herein.

The location of the control members differs, some makers mounting the various devices in a horizontal line while others group them compactly, the installation varying with respect to the position and convenience of the driver. For example, on the new Cole car, made by the Cole Motor Car Company, Indianapolis, Ind., the control is at the right and the lighting, starting and ignition switches are placed upon the right of the dash with the pressure feed gauge in the centre and the oil sight feed and speedometer at

Showing the Control and Indicating Devices on Dash of National.

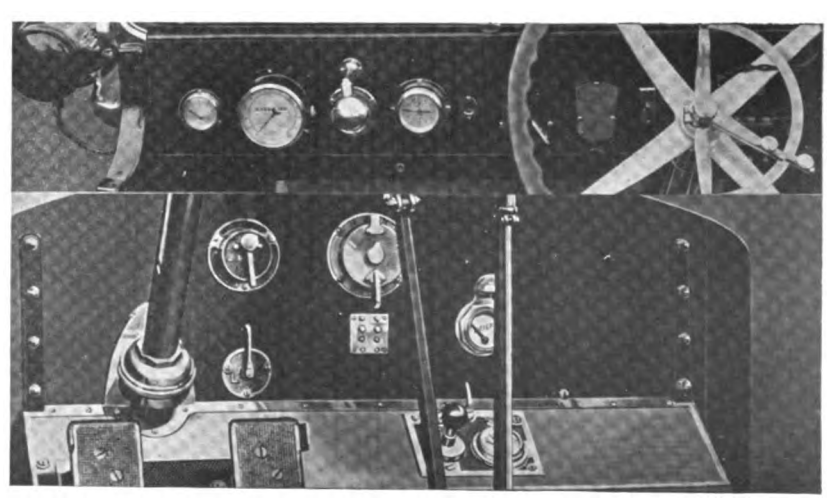
Digitized by Google

Controller Box of Apico System Mounted Between Front Seats of Car.

the left. The appearance is extremely neat as the various control and indicating devices are mounted flush on a highly polished board. The ignition and starting controls are combined in a unit and are of the press button type making for compactness. The usual multiple lighting switch is also conveniently located.

The driver is placed at the left in 1913 Haynes models, made by the Haynes Automobile Company, Kokomo, Ind., consequently the control devices are positioned on the dash at the left. Seven units are installed, these including the cut-out to which the leads from the dynamo are attached, the multiple electric lighting switch, oil sight feed, dash lamp, ignition switch, fuel control and speedometer. Unlike some electric motor starting systems the control of the Haynes is by the gear shifting lever, it being moved into a starting slot on the quadrant.

The indicating and control units of the Warren car, made by the Warren Motor Car Company, Moline, Ill., are neatly arranged in a horizontal row upon the dash with the lighting, starting and ignition switches at the right, pressure gauge, speedometer, oil sight feed and clock being located at the left. A dash lamp is so arranged over the lubrication indicator that the speedometer and clock dials are also illuminated.



The plain dash of the Palmer-Singer machine, made by the Palmer & Singer Manufacturing Company, Long Island City, N. Y., carries but five units, these including from left to right the combined lighting switch, automatic cut-out and ammeter, air pressure gauge, ignition switch, gas pressure gauge and oil sight feed. A compressed air motor starter is utilized, being operated by a pedal in the toeboard, but not shown in the accompanying illustration.

The indicating and control devices of the Lozier, made by the Lozier Motor Company, Detroit, are grouped on the dash at the right of the steering column, which is located at the left. The toeboard is also utilized for a combination unit, as will be noted.

Compactness is noticeable in the grouping of the dash members with the National model, made by the National Motor Vehicle Company, Indianapolis, Ind. They are arranged between the dash boxes, occupy but little space and are easily accessible to the operator. At the extreme left is the ammeter, below which is the multiple switch handle controlling the groups of electric lamps. The switch proper is mounted on the dash under the hood and only the handle is in view to the driver, a fitting making for neatness. At the left of the lighting handle is the control for the carburetor, enabling the driver to vary the mixture for starting and running. The ignition switch is located in the centre and at the right is the tank pressure gauge and speedometer, between which members is the hooded electric dash light.

The control and indicating members of the Pierce-Arrow models, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., are noticeable for their accessibility to the operator as well as the small space in which they are mounted upon the dash. The room occupied is approximately the same size as one of the small doors to the tool compartments in either side of the dash and the devices being mounted flush are very attractive to the eye.

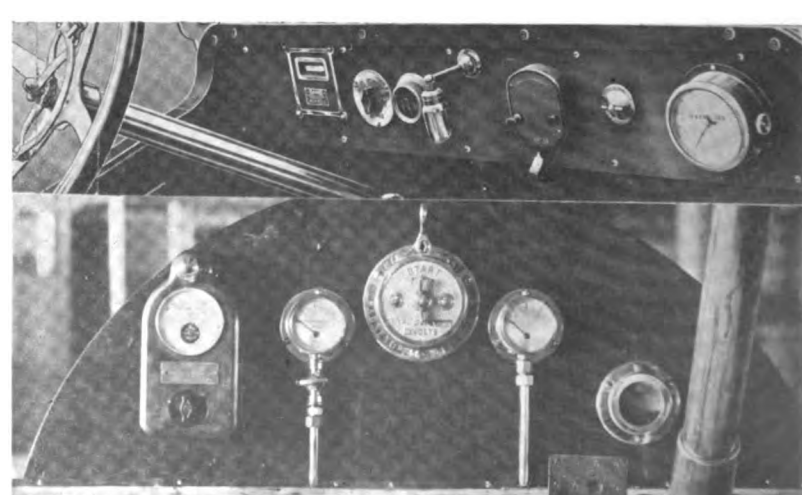
The equipment of the Pierce-Arrow includes electric lighting and a motor starter, the latter being of the compressed air

Showing Arrangement of Dash Equipment on Warren at Top and Lozier in Lower View.

Digitized by Google

type. It not only serves to relieve the driver of the work of cranking the motor, but is employed for inflating the tires with the engine inoperative, as a supply of compressed air is stored in a tank ready for service at an instant's notice. For tire inflation, however, the company recommends the utilization of the power pump direct owing to the high pressure of the tank and a nipple attachment is incorporated in the plate containing the air starter control plate on the toeboard. A suitable length of tubing is provided for connecting the air line with the tire valves. The motor starting button is also located upon the panel at the extreme left, being operated by the pressure of the foot, while suitable valves for controlling the air between the tank, gauges, etc., are neatly arranged.

The Dash Equipment of the Cole Car Is Mounted Flush on a Richly Polished Surface.



On the dash above the air control members are located the pressure gauges indicating the condition of the air tank and lubrication system. At the lower left hand corner is placed the push button type of switch controlling the electric lights, while at the extreme right is the voltmeter, indicating the operation of the dynamo. Between the lighting switch and voltmeter is the ignition switch, immediately above which is located the fuel gauge. An electric lamp is mounted below the gauge, indicating the amount of gasoline on hand, illuminating this and the dials of the other control members. Use also is made of the dash for two tool compartments, which with the accessibility of the control members simplifies the operation of the car as well as makes for convenience.

A clean dash is exemplified by the Packard construction of control and the ready accessibility of the control board mounted on the steering column beneath the wheel is original with the Packard Motor Car Company, Detroit. As will be noted by the accompanying illustration the board is fitted to and retained on the steering column by means of a split screw clamp, and when so attached there is sufficient clearance between it and the steering wheel to permit free movement of the hand of the operator. In addition it is within easy reach and in plain sight.

At the top centre of the board is the ignition switch of the Bosch dual coil system, the control lever of which is easily accessible, and a Yale lock is incorporated to prevent tampering with the electrical apparatus. The lighting switch is secured to the left side of the board and the control of the various lights, these including in addition to the usual equipment speedometer and license number members, is by push button with each circuit plainly marked.

At the right of the board is the carburetor regulating device, which comprises a stationary member, having indicating arrows and being lettered "gas" and "air," and a knurled wheel. The latter is calibrated, two sets of numbers being provided beginning with zero. By rotating the knurled wheel the driver is enabled to enrich the mixture by supplying more fuel or by cutting down the air without leaving the seat. By utilizing the numbers it is a simple matter to reset the carburetor to the original adjustment.

The button employed in connection with the electric motor starter is placed on the right top corner of the board and provision also is made for the fitting of the operating button of an

Control and Indicating Devices of Haynes Are Mounted in a Horizontal Plane—Lower View Depicts Dash Equipment of Palmer-Singer.

Digitized by Google

electric signalling device. The board itself is a cored casting, carefully finished to match the trimmings of the car. The wires are carried in conduit in a very compact manner and the board is stationary, being attached to the outer steering column, which does not rotate.

The construction and operation of the Aplco electric light and motor starting system, made by the Apple Electric Company, Dayton O., is such that the dash is relieved of the control members, even the ignition switches. A controller, a box like device, is located between the front seats of the car, as will be noted by the accompanying illustration. Within this housing is contained the automatic cut-out and regulator of the lighting system, also the switches utilized for converting the voltage of the cells of the storage battery from six to 30 for starting purposes.

The control members are best explained by the operation of both systems. To start: The small lever on the side of the controller is pushed forward, a movement which switches on the ignition current and arranges the battery in series for starting and also makes connection between the motor and battery. Upon the engine starting the control lever is moved to a running position, breaking the connection between the battery and the starting motor, and reestablishing the cells of the battery in multiple for charging by the dynamo. Moving the lever to a central position cuts off the ignition. A lock is provided for securing the lever in this position, preventing starting of the car.

The lighting switch is mounted on the top of the controller and any group of lights may be utilized. A feature of the device is that a simple movement of the switch enables the driver to dim the lights when meeting approaching vehicles. The top of the controller also carries a small bulb serving as a pilot light and inspection lamp.

Lack of space prevents taking up in detail the location of the control and indicating devices as applied to the dash on all cars, but those presented will enable the reader to note the provision made by the manufacturer to locate these members in a convenient and accessible position to the operator.

SPECIAL TRAIN.

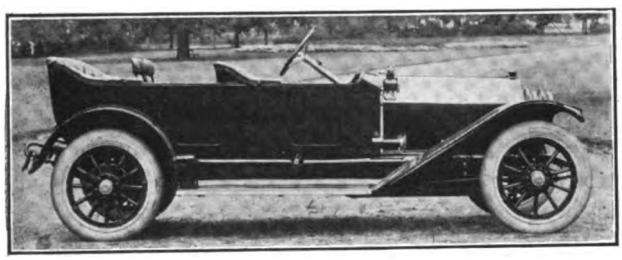
Indiana Makers to Visit New York Show.

A large number of Indiana motor car manufacturers and others representing the industry left Indianapolis, Jan. 9, in a special train bound for the big double show in New York City. The route was over the Pennsylvania railroad and the schedule was arranged so as to reach the Metropolis on Saturday. Among the members of the party were the following:

Manufacturers' car—Guy O. Simons, Motor Car Manufacturing Company; E. Mack Morris, Great Western Automobile Company; J. W. Esterline, Esterline Company; E. G. Dupreau and H. W. Griffith, Remy Electric Company; J. A. Daugherty and Charles Reynolds, Irvin Robbins Company; H. H. Rice and A. B. Wagner, Nordyke & Marmon Company; L. L. Banford, Stewart speedometers, and representatives of the Haynes Automobile Company and Marathon Motor Works.

Presidents' car—C. P. Henderson and W. D. Edenburn, Henderson Motor Car Company; Mr. and Mrs. C. B. Warren, Haynes Automobile Company party were the following: Smith, Maxwell-Briscoe Motor Company; J. I. Handley, American Motors Company and Marion Motor Car Company; M. D. MacNab, Marion Motor Car Company; H. W. Stutz, Ideal Motor Car Company; G. A. Weidley, Premier Motor Manufacturing Company.

Accessory men's car—C. L. Briggs and Douglas Wheeler, Wheeler & Schebler; W. E. Esterly, Firestone Tire & Rubber Company; R. R. Bunch, B. E. Griffey Company; L. R. Colvin and C. J. Cadwell, New-Miller Manufacturing Company; L. R. Smith, Eisemann magnetos; S. C. Bohannon, Truffault-Hartford shock absorbers; Gilbert Anderson, Ideal Motor Car Company; Robert Maypole, Stutz Auto Parts Company; Edward Spacke, Spacke Machine Company; G. W. Graham, Federal Motor Works; T. B. Funk.



Sales managers' car—Mr. and Mrs. L. Switzer, Mr. and Mrs. C. Gibson and Mr. and Mrs. Hoover Holton, Empire Automobile Company; Mr. and Mrs. L. McCullough; E. S. Lawrie, Spacke Machine Company; Mr. and Mrs. C. L. Diers, Goodyear Tire & Rubber Company, and representatives of the Cole Motor Car Company, American Motors Company and Haynes Automobile Company.

Press and advertising men's car—D. B. Williams, American Motors Company; Harlow Hyde, Empire Automobile Company; Bruce Daniels, Motor Car Manufacturing Company; R. W. Macey, Premier Motor Manufacturing Company; W. McK. White, Marion Motor Car Company; R. J. Irvin, R. J. Irvin Company; C. H. Gurnett, J. L. Ashbaugh, B. F. Lawrence, C. H. Henderson and W. E. Seip, Jr.

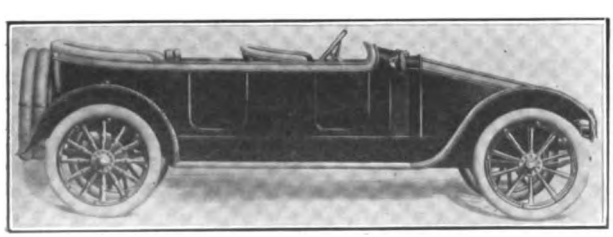
Some New 1913 Models

THE Ideal Motor Car Company, Indianapolis, Ind., which brought out a four-cylinder Stutz car in 1911, has added a six-cylinder chassis, to

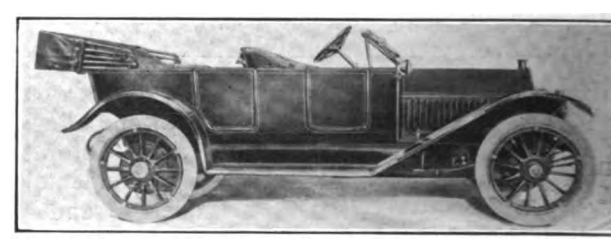


Stutz Model 6-B Six-Passenger Touring Car.

which three body types are fitted. This new car has all the features of the four, and will be recognized immediately as a continuation of the design which has proven so successful on track and road during the past year. Equipment includes a Berdon Matchless electric lighting system.

The motor is of the T head type. The cylinders are cast in pairs and have bore of 4.25 inches and stroke of five. The rating is 43.3 horsepower. Lubrication is by force feed through hollow crankshaft. Carburetor is a Stromberg. Ignition is by Eisemann high-tension magneto. Clutch is a multiple disc. Transmission and rear axle are of the Stutz patented design, the former giving three forward speeds and reverse. Drive is by shaft. Both sets of brakes are internal expanding. Springs are semi-elliptic all around. Tires are 34 by 4.5 inches.

CROXTON MODEL B-6.

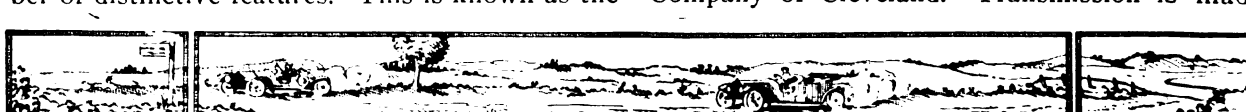


Since its removal to Washington, Penn., the

Croxton B-6 Six-Passenger Touring Car.

Croxton Motor Car Company has brought out a new six-cylinder model, which presents a number of distinctive features. This is known as the model B-6 and is offered as a touring car. A four-cylinder touring car also is manufactured, this incorporating many of the features found in the six, including the radiator in front of the dash and the use of a Renault type of radiator in front of that. The driver is placed at the left and the control levers in the centre, while the North East combined electric starter and lighting system is supplied as regular equipment.

The six-cylinder motor is rated at 40.9 horsepower and is cast en bloc. The bore is 4.125 inches and the stroke 5.5. The motor is of the L head type, the valves being located on the left. Lubrication is by splash. Carburetor is a Schebler. Ignition is by Mea single high-tension magneto. Clutch is a cone. Transmission provides four forward speeds and reverse with direct drive on the fourth. Rear axle is of the full floating type. Two sets of internal expanding brakes are



Grant Six 50 Horsepower Touring Car.

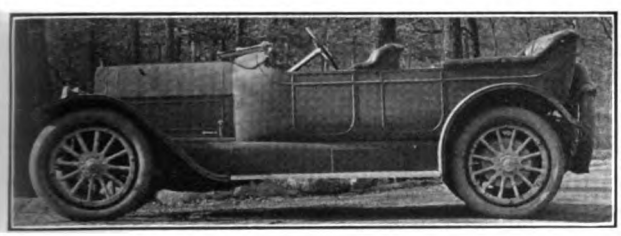
fitted. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by 4.5 inches.

GRANT SIX.

The Grant Motor Car Company, Cleveland, O., is one of the new concerns of the industry which is producing a six-cylinder car rated at 50 horsepower listed as a semi-assembled chassis in which the product of the leading parts makers of the country are to be found. It is maintained that every part is standardized and the result of specialized effort.

The motor is a Wisconsin of the T head type. The carburetor is a Marvel. Ignition is by an imported Eisemann magneto. The clutch is a dry multiple disc, made by the Grant-Lees Machine Company of Cleveland. Transmission is made

Digitized by Google



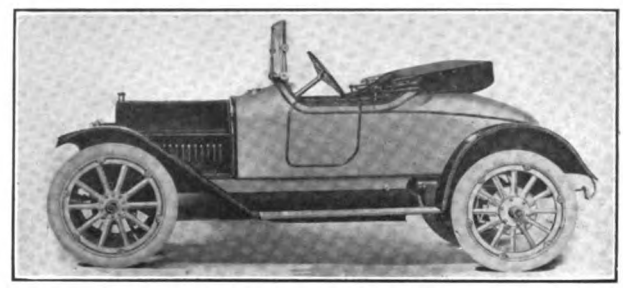
Some New 1913 Models

by the same concern and gives three forward speeds and reverse. Motor, clutch and transmission are assembled as a unit power plant. The large full floating Timken rear axle is fitted with 18-inch brake drums. Springs are three-quarter elliptic, made by the Cleveland-Canton Spring Company, Canton, O. Tires are 36 by four inches.

SPEEDWELL MODEL B.

A new six-cylinder car is the Speedwell model B, made by the Speedwell Motor Car Company, Dayton, O., which has made only fours heretofore. This chassis is offered with the option of a new rotary valve motor or the poppet valve type described below. The equipment is complete in every way, including electric lighting and motor starter.

With the poppet valve motor the valves are

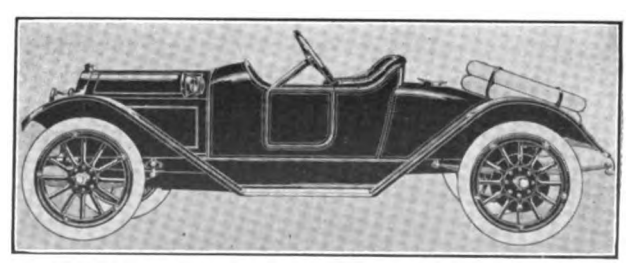


Speedwell Model B Five-Passenger Touring Car.

on the right side. Cylinders are cast in threes, with bore of 4.125 inches and stroke of five. The horsepower rating is 50. Lubrication is by splash. Ignition is by Bosch high-tension magneto. Clutch is a multiple disc. Transmission is selective, three speeds forward and reverse. Drive is by shaft to full floating rear axle. Service brakes are external contracting and emergency, internal expanding, both sets being on the rear wheel hubs. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by 4.5 inches.

CARTERCAR MODEL 5.

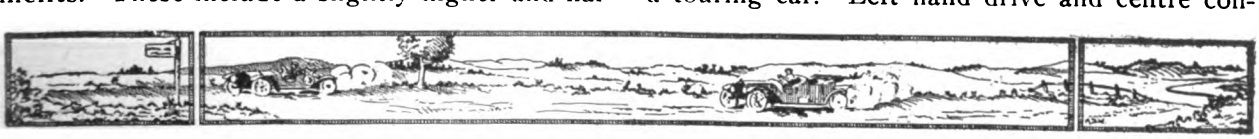
Continuing, of course, its well known friction drive, the Cartercar Company, Pontiac, Mich., announces its model 5 chassis with several improvements. These include a slightly higher and narrower motor, valve action encased, new system of lubrication, placing the gasoline tank under the cowl of the dash, and the use of the Jesco com-



Carterear Model 5-B Friction Driven Roadster.

bined electric starter and lighting system.

The motor is a four-cylinder unit of the L head type, valves being located at the left. The cylinders are cast in pairs with bore of 4.125 and stroke of 4.75. Lubrication is by combined force feed and splash. Carburetor is a Schebler. Ignition is by Briggs low-tension magneto. Transmission is on the friction principle with an unlimited number of speeds. Drive is by single chain, in oil, to a three-quarters floating rear axle. Service brakes are external contracting and emergency, internal expanding. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by four inches.



AMES KENTUCKY THOROUGHBRED.

The Ames Motor Car Company, Owensboro, Ky., has been reorganized with additional capital and is now presenting its Ames Kentucky

Ames Model 44 Kentucky Thoroughbred Roadster.

Thoroughbred line in one chassis and two body designs, model 44 being a roadster and model 45 a touring car. Left hand drive and centre con-

trol, Gray & Davis electric starter and lighting system and other new features are incorporated.

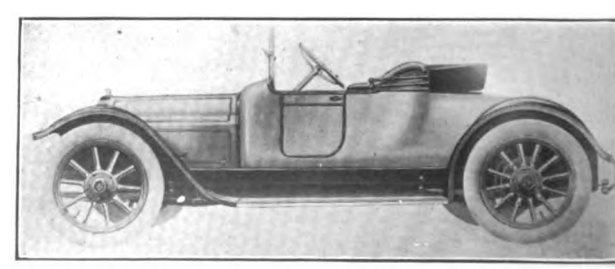
The motor is a Continental of the L head

Lenox Six-Cylinder, Five-Passenger Touring Car.

type, with cylinders cast en bloc, and with bore of 4.125 inches and stroke of 5.25. Lubrication is by pump circulation. Carburetor is a Schebler. Ignition is by Remy dual system. Clutch is a multiple disc lined with Raybestos. Transmission is a Warner selective type, three speeds forward and reverse. Drive is by shaft to full floating rear axle. Springs are semi-elliptic front and three-quarter elliptic rear. Tires are 36 by four inches. Rims are Baker bolted-on demountable, with extra rim and tire holder furnished as regular equipment.

LENOX MODEL M C.

With factory at Jamaica Plain, the Lenox Motor Car Company, Boston, Mass., which has been producing four-cylinder Lenox cars for the past three years, announces a six-cylinder chassis known as model M C for the coming season. The new chassis will embody all of the characteristics which have made for success in the four, and in common with it will be fitted with the Gray & Davis electric lighting and starting system.



The motor has bore of four inches and stroke of five, being rated at 60 horsepower. The cylinders are cast in blocks of three and are of the T head type. Lubrication is by force feed. Carburetor is made by the Lenox company and is the same in type as used on the four, but larger. Ignition is by Mea high-tension magneto. Clutch is a cone. Transmission is selective, three speeds forward and reverse. Drive is by shaft to a three-quarters floating rear axle. Brakes are internal expanding, lined with Raybestos. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by 4.5 inches.

GARFORD MODEL 15-G.

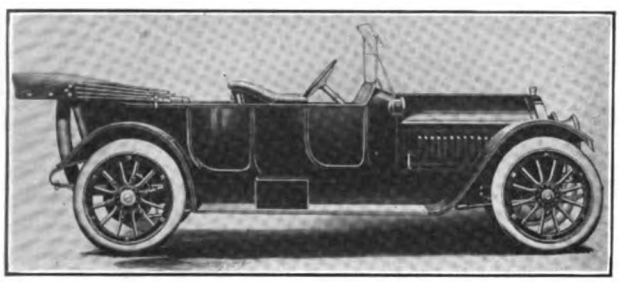
An entirely new six-cylinder Garford, made by the Garford Company, Elyria, O., will make its appearance during the New York show. This chassis will be fitted as a touring car, town car and roadster. Several innovations will be noted, among them a new long stroke motor, four-speed transmission, centre control, left hand drive, electric starting and lighting, heater built into the motor, power tire pump and single large headlight mounted on the radiator.

The motor has bore of 3.75 inches and stroke of six, cast en bloc, and with the assembly suspended at four points on the frame, doing away with the sub-frame or cross member. Lubrication is by combined force feed and splash. The carburetor is of special design, held to be absolutely automatic in operation, except with respect to weather conditions. It is located at the left of the motor and delivers gas through a two-way intake pipe, each branch serving three cylinders. The ejector type of manifold is utilized, providing a suction for exhaust gas from three cylinders while the other three are charging.

The clutch is a cone member with cork inserts. Transmission is selective, four forward speeds and reverse, direct on the third. Final drive is by shaft to full floating rear axle. Brakes

Garford Model 15-G Six-Cylinder Roadster.

are contracting and expanding on rear wheel hubs. Springs are semi-elliptic in front and three-quarter elliptic in the rear, the latter being placed



Digitized by Google

Some New 1913 Models

under the axle. Tires are 36 by 4.5 inches.

The usual flywheel is replaced by the combined motor-generator of the U. S. L. starting

Cole 60 Six-Cylinder Touring Car, Series 8.

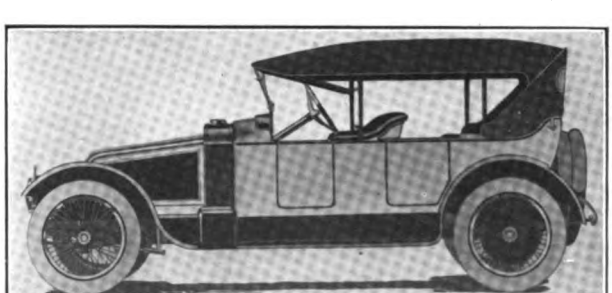
and lighting system. The batteries and regulator are carried in the cowl dash. The fitting of a single headlight is held to be an innovation which will make for the elimination of additional equipment and expense.

COLE 60, SERIES 8.

Still another concern to add a six-cylinder car is the Cole Motor Car Company, Indianapolis, Ind., this being the Cole 60, series 8. Five body designs are offered, including five-passenger convertible seven-passenger touring, four-passenger toy tonneau, roadster, coupe and Berlin limousine. It may be added that no radical changes from standard Cole practise are incorporated.

The motor has bore of 4.125 inches and stroke of 4.75. The cylinders are cast in pairs, of the L head type, the valves being on the left side. Lubrication is by the constant level splash system. Carburetor is a model O Schebler. Ignition is by the Delco system, comprising a high-tension distributor, current for which is supplied by the storage battery actuating the motor starter, or direct from the generator. Clutch is an aluminum cone with leather facing. Transmission is selective, three speeds forward and reverse. Drive is by shaft to a full floating rear axle. Service brakes are of the external contracting type and emergency, internal expanding. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 37 by 4.5 inches.

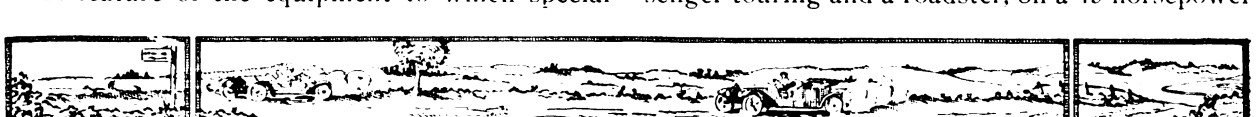
A feature of the equipment to which special attention is called by the maker is the installation of the various dash control and indicating devices on a highly polished board just at the rear of the cowl, making for a neat appearance and ease of location by the operator. Another innovation is the fitting of a special attachment for the number plate in front.



KEETON MODEL A. E.

A new car of unusual appearance is the Keeton, made by the Keeton Motor Company, Detroit, It is a six-cylinder model, with body design resembling those seen abroad. The radiator is placed directly in front of the dash, with the motor under a Renault type hood. Wire wheels are fitted as standard equipment and other features include Jesco electric lighting and starting system, left hand drive and centre control.

The motor is of the L head type, valves being located on the left. Cylinders are cast en bloc, with bore of 3.75 inches and stroke of 5.5. Lubrication is by force feed system. Carburetor is a Zenith. Ignition is by Mea magneto with fixed spark. Clutch is a multiple disc. Transmission is selective, four speeds forward and reverse, with direct on the third. Rear axle is of the full floating type. Tires are 36 by 4.5 inches.



PALMER-SINGER BRIGHTON SIX.

Announcing a popular priced six-cylinder model, designated the Brighton Six, the Palmer &

Keeton Model A. E. Touring Car.

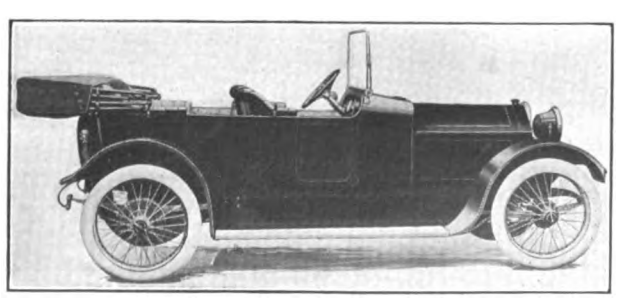
chassis. The construction differs slightly from the standard 6-60 Palmer-Singer, particularly



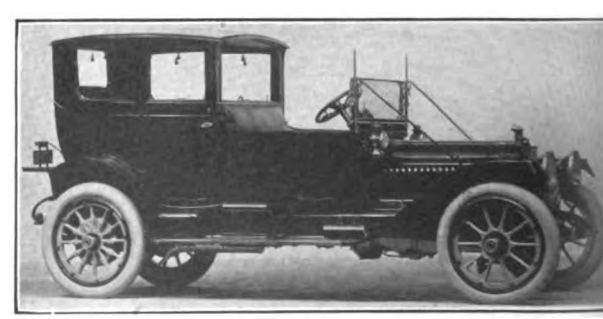
Palmer-Singer Brighton Six Five-Passenger Touring Car.

with reference to the utilization of a three-speed transmission combined as a unit with the rear axle and the cylinders cast in blocks of three instead of in pairs. Equipment includes Dyneto electric lighting system and an air starter.

The motor has bore of four inches and stroke of five. It is of the T head type, and both the intake and exhaust ports are siamesed. Lubrication is by splash. Carburetor is a C. R. G. Ignition is by Eisemann high-tension magneto, and distributor and coil. Clutch is a multiple disc, running in oil. Transmission is selective, three speeds forward and reverse. Brakes are internal expanding. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by four inches.

HENDERSON MODEL 47.

One of the new productions which will be shown for the first time this year is the Hender-



Henderson Model 47 Touring Car with Wire Wheels.

son, made by the Henderson Motor Car Company, Indianapolis, Ind. The first car of this make appeared Memorial Day, and has been produced during the remainder of the season as models 44 and 46. Models 45 and 47 have now been added, being the same in general construction but with McCue detachable wire wheels.

The motor is a four-cylinder unit, cast en bloc, with bore of 4.125 inches and stroke of 5.25, giving an S. A. E. rating of 28.6 horsepower. Lubrication is by pump circulation. Carburetor is a Rayfield. Ignition is by the Remy dual system. Clutch is a leather faced cone. Transmission is selective, on axle, three forward speeds and reverse. Drive is by straight line shaft to semi-floating rear axle. Tires are 34 by four inches.

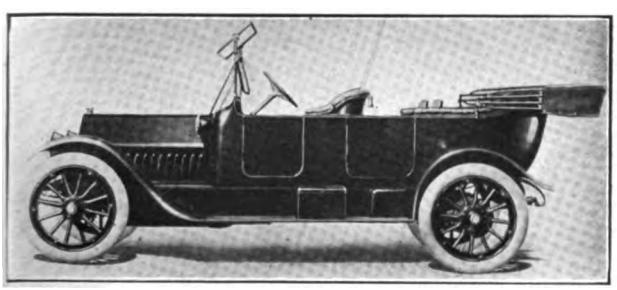
PACKARD MODEL 38.

Answering what it regards as a demand for a six-cylinder machine of lesser power, the Pack-

Packard Model 38 Six-Cylinder Cabette.

ard Motor Car Company, Detroit, is producing its Packard model 38, equipped with touring, limousine, phaeton and "cabette" bodies. Distinguishing features over previous Packard design include left hand drive and left hand control, electric motor starter and lighting, starting, ignition and carburetor controls all located on the steering column under the wheel, a decidedly convenient arrangement.

The motor is of the L head type with valves located on the right. The cylinders are cast in pairs, with bore of four inches and stroke of 5.5 giving an S. A. E. rating of 38 horsepower. Lubrication is by the pressure system. Carburetor is a Packard. Ignition is by Bosch high-tension dual system. Clutch is a Packard dry plate



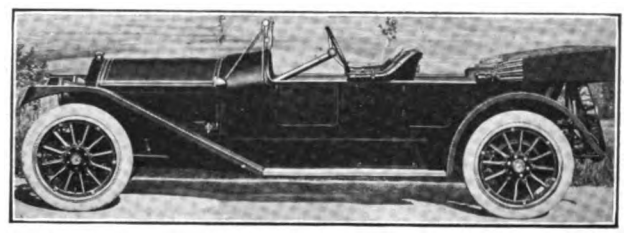
Digitized by Google

Some New 1913 Models

Transmission is progressive, three speeds forward and reverse. Drive is by shaft to semi-floating rear axle. Service brakes are contracting and emergency, expanding, both sets being on the rear wheels. Springs are semi-elliptic in front and three-quarter scroll elliptic in rear. Tires are 36 by 4.5 inches front and 37 by five rear.

STUDEBAKER SIX.

The Studebaker Corporation, Detroit, which has dropped the designations of E-M-F and Flanders with its four-cylinder models, replacing them with the Studebaker 35 and the Studebaker 25, respectively, and has added a six-cylinder chassis which will be fitted with touring car and limousine bodies. Several new features will be apparent from a study of the brief specifications presented herewith and the accompanying illustration. These include the Wagner electric starter and lighting system.

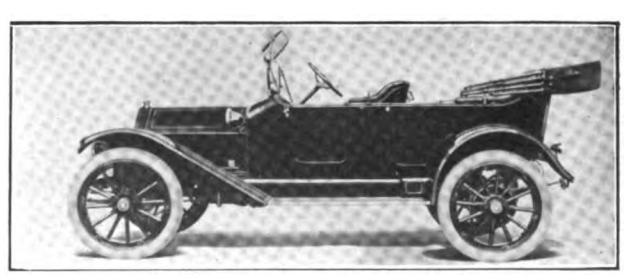


Studebaker Six Touring Car.

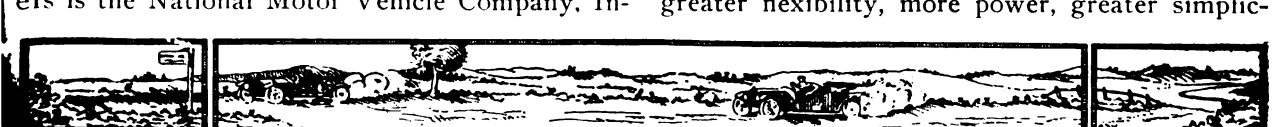
The motor is a neat block casting, rated at 40 horsepower. The bore is 3.5 inches and the stroke five. Ignition is by Splitdorf magneto and coil with batteries. Clutch is a leather faced cone. Transmission is selective, three speeds forward and reverse. Drive is by shaft to full floating rear axle. Service brakes are external contracting and emergency, internal expanding. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 34 by four inches.

NATIONAL IMPROVED SERIES V.

Another concern which produces series models is the National Motor Vehicle Company, Indianapolis, Ind., in its improved series V chassis, which is fitted with a wide variety of body designs, including semi-racing roadster, speedway roadster, toy tonneau, five-passenger touring, seven-passenger touring, limousine, coupe and sedan. The line is distinctive because of the left hand drive and centre control, as well as the use of the Gray & Davis electric lighting and starter.



National Improved Series V Toy Tonneau.



The motor is a four-cylinder unit, having bore of 4.875 inches and stroke of six, rated at 40 horsepower. Cylinders are cast in pairs. Lubrication is by force feed. Carburetor is a Rayfield, with an option of Schebler if desired. Ignition is by Bosch dual double system. Clutch is a cone. Transmission is selective, three speeds forward and reverse. Drive is through a straight line shaft to bevel gear on full floating rear axle. Two sets of brakes are fitted. Springs are semi-elliptic front and three-quarter elliptic rear. Tires are 36 by 4.5 inches.

CUTTING MODEL 40.

In presenting the Cutting model 40, the Cutting Motor Car Company, Jackson, Mich., has incorporated improvements tending toward greater flexibility, more power, greater simplic-

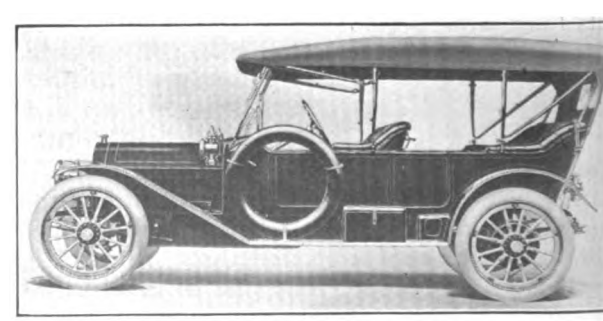
ity, elimination of many parts, adoption of unit power plant, motor starter, increased wheelbase, larger wheels, etc. Two body designs are offered,

Edwards-Knight Model 25 Four-Passenger Torpedo.

a roadster known as model A-40, and a touring car designated B-40.

The motor is a four-cylinder unit of the L head type, with valves on the left side. The cylinders are cast en bloc and have bore of four inches and stroke of five. Lubrication is by force feed. Carburetor is a Rayfield. Ignition is by the Remy dual system. Clutch is a multiple disc. Transmission is selective, three speeds forward and reverse. Drive is by shaft to three-quarters floating axle. Two pairs of Westinghouse double acting equalizing brakes are fitted. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by four inches.

EDWARDS-KNIGHT MODEL 25.



Besides being an entirely new production, the Edwards-Knight model 25, made by the Edwards Motor Car Company, New York City, presents a number of innovations, insofar as American practise is concerned. Features of the design include: Double dropped frame, Lanchester type rear suspension, worm drive, wire wheels, Knight motor, left hand drive, centre control and U. S. L. electric lighting and motor starter. As announced by the maker, American and English characteristics indorsed by sound engineering practise, have been incorporated. Six body types are listed, these being five-passenger touring, four-passenger roadster, seven-passenger limousine, two-passenger speedster, two-passenger roadster and seven-passenger landaulet.

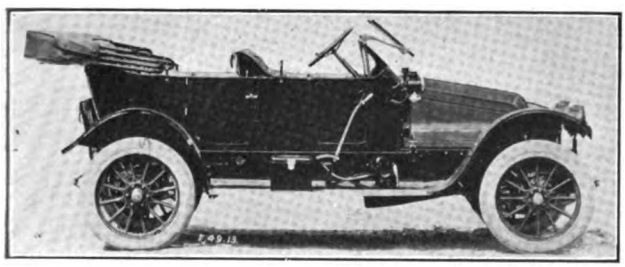
The motor is a four-cylinder unit rated at 25 horsepower, with bore of four inches and stroke of 5.5. Lubrication is by the force feed system. Carburetor is an S. U., made under license from Great Britain. Ignition is dual, a Simms magneto being employed. Clutch and gearset are combined, the former being of the dry disc type, lined with Raybestos. Transmission gives four forward speeds and reverse, direct on the third. Drive is by underneath worm on full floating rear axle. Service brakes are external contracting and emergency, internal expanding. Springs are semi-elliptic in front and Lanchester inverted semi-elliptics in rear. Tires are 36 by five inches.

HERRESHOFF SIX-36.

One of the makers to produce its initial six-cylinder model is the Herreshoff Motor Company, Detroit, this being a popular priced 36 horsepower car designated as the Herreshoff Six-36. It is offered with two body designs, a five-passenger touring and a two-passenger roadster. In common with the other models produced by this concern, it will be fitted with an electric lighting system and motor starter, four-speed transmission, left hand drive and centre control.

The Six-36 motor is of the T head type, cast en bloc, with bore of 3.375 inches and stroke of 4.5. Lubrication is by splash. Carburetor is a model B Stromberg. Ignition is provided by the combined Westinghouse electric lighting and starter system, and the control of the spark is accomplished automatically. The clutch is a multiple

Herreshoff Six-36 Five-Passenger Touring Car.



disc, operating in oil. Transmission is selective, four forward speeds and reverse, direct on the fourth. Drive is by shaft to semi-floating rear

Digitized by Google

Some New 1913 Models

axle. Service brake is of the external contracting type and emergency, internal expanding, both lined with Raybestos and both in the rear wheels.

Franklin Model M, Little Six Touring Car.

Springs are semi-elliptic in front and full platform in the rear, affording a three point suspension of the body. Tires are 34 by four inches.

FRANKLIN MODEL M.

Having abandoned the yearly model, the H. H. Franklin Manufacturing Company, Syracuse, N. Y., is making announcement of new series as fast as improvements are incorporated. Earlier in the year series 2 replaced series 1, and with it came a new "little six," designated as model M and rated at 30 horsepower. Series 3 also includes this chassis, equipped with a touring car body and as a two-passenger victoria phaeton. The latter has an auxiliary seat in the rear, making provision for two additional persons, and this is designed to fold into the deck when not in use. The body is held to be of the English type, with its long cowl dash, under which the fuel tank is located. All six-cylinder models in the new series are equipped with the Entz electric starter and lighting system.

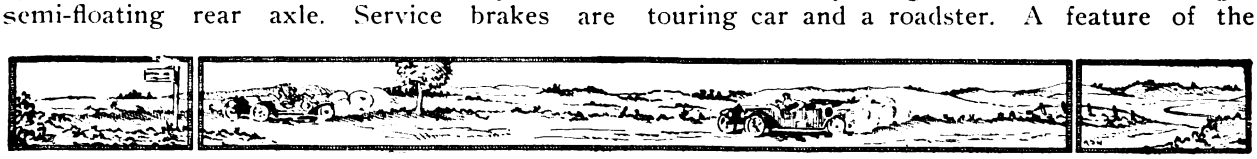
The motor of the model M is of the well known Franklin air-cooled type, with bore of 3.625 inches and stroke of four. The cylinders are cast individually and are of the valve in the head type. Lubrication is by force feed. Carburetor is a special float feed type, made by the Franklin company. Ignition is by Bosch high-tension magneto. Clutch is a multiple disc running in oil. Transmission is selective, three speeds forward and reverse. Drive is by shaft to semi-floating rear axle. Service brakes are double acting on the brake drum, and emergency, double acting on rear wheels. Springs are full elliptic all around. Tires are 34 by 4.5 inches.

SPAULDING MODEL G.

The Spaulding Manufacturing Company, Grinnell, Ia., has replaced its two models of last year with a new four-cylinder, 40 horsepower chassis, denominated model G. It is fitted with three body types, these being touring, torpedo and roadster. Special features include Gray & Davis electric starting and lighting system, centre control levers and left hand drive.

The motor is cast en bloc, with bore of 4.25 inches and stroke of 5.5. Lubrication is by a self-contained, circulating system. Carburetor is a model O Schebler. Ignition is by the Eisemann dual system. Clutch is a cone with inserted springs, leather faced. Transmission is selective, three speeds forward and reverse. Drive is by shaft to full floating rear axle. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by four inches.

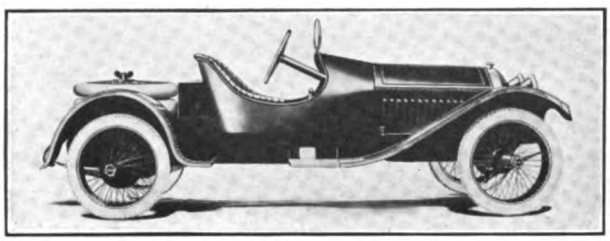
Standard equipment includes electric headlights, side and tail lamps, electric horn, mohair top, spare tire and rim with holders.



OAKLAND MODEL 6-60.

A new addition to the Oakland line, made by the Oakland Motor Car Company, Pontiac, Mich.,

Spaulding Model G Five-Passenger Touring Car.

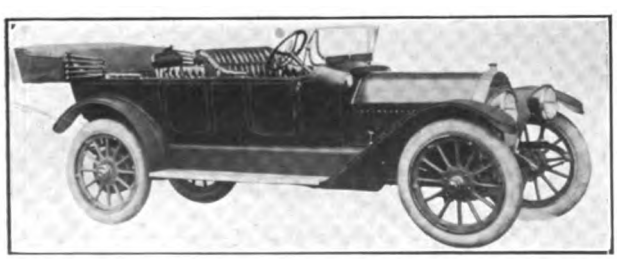


is a six-cylinder chassis, known as model 6-60, to which two body designs are fitted, these being a touring car and a roadster. A feature of the

Digitized by Google

Some New 1913 Models

equipment is the use of the Delco combined electric starting, lighting and ignition system, or the



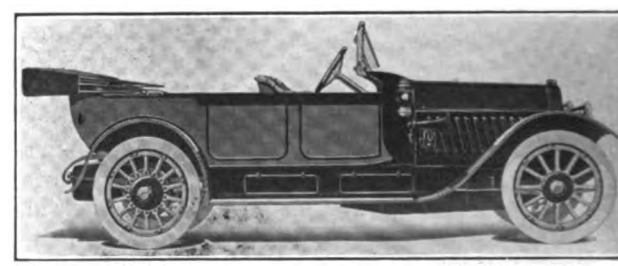
Oakland Model 6-60 Two-Passenger Roadster.

Deaco lighting and ignition system and an air starter, the latter being slightly lower priced.

The motor in the new chassis is rated at 60 horsepower. The cylinders are cast in pairs, with bore of 4.125 inches and stroke of 4.25, and are of the L head type, the valves being on the left side. Lubrication is a combined system, force feed and splash. Carburetor is a Stromberg. Clutch is a leather faced cone. Transmission is selective, three speeds forward and reverse. Drive is by shaft to full floating rear axle. Both sets of brakes are internal expanding on rear axle. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 34 by 4.5 inches. On the roadster, wire wheels are employed, these being of special design, but artillery wood wheels and demountable rims are regular equipment on the touring car.

PILOT 60.

The leader of the Pilot line, offered by the Pilot Car Sales Company, Richmond, Ind., is the



Pilot 60 Five or Seven-Passenger Touring Car.

Pilot 60, a six-cylinder chassis, rated at 38.4 horsepower, but said to have developed 67 under brake test. The touring body is designed to accommodate five or seven people.

The motor is a Teeter, of the T head type, cast en bloc. The bore is four inches and the stroke six. Lubrication is by the splash system. Carburetor is a Stromberg. Ignition is by the Eisemann dual system. Clutch is a cone. Transmission is a Warner, three speeds forward and reverse. Drive is by shaft and bevel gear to full floating rear axle. Both sets of brakes are internal expanding. Springs are semi-elliptic all around. Tires are 37 by 4.5 inches. Equipment includes Gray & Davis electric lighting and starter.

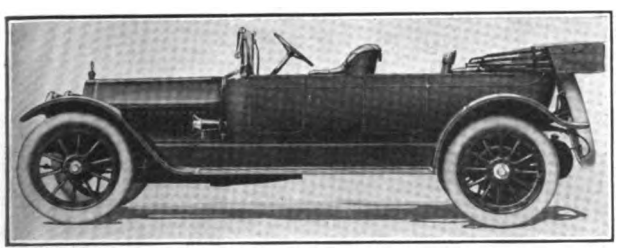
OLDSMOBILE MODEL 53.

The Oldsmobile model 53 is an entirely new six-cylinder chassis, rated at 42 horsepower, pro-

Oldsmobile Model 53 Five-Passenger Touring Car.

duced by the Olds Motor Works, Lansing, Mich. In some respects it resembles the Oldsmobile Limited in general design and construction, although made to sell at a much lower price. Three types of bodies are fitted, these comprising a seven-passenger touring, five-passenger touring and a four-passenger tourabout.

The motor is of the L head type, the valves being on the left side. The cylinders are cast in pairs and have bore of 4.125 inches and stroke of 4.75. Lubrication is by combined force feed and splash. Carburetor is a Stromberg. Ignition is by the Delco system, which also supplies current for starting and lighting. Clutch is a cone. Transmission is a unit with the power plant, and affords three forward speeds and reverse. Drive is by shaft to floating rear axle. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by 4.5 inches.



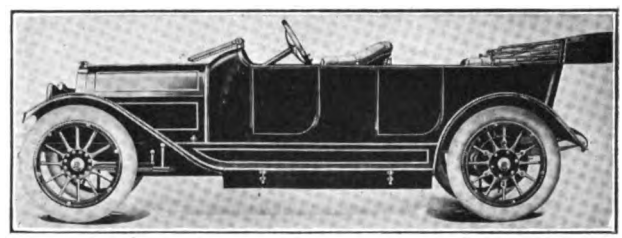
Digitized by Google

Some New 1913 Models

In addition to the combined electric starting, lighting and ignition equipment, a power driven air pump is fitted, as well as Warner speedometer and clock, Klaxon warning signal, Truffault-Hartford shock absorbers on both front and rear, extra tire rim, etc. Special attention is drawn to the generous width of doors.

STEARNS-KNIGHT SIX.

A year ago the F. B. Stearns Company, Cleveland, O., brought out its Knight engined four-cylinder model. This year there is a Stearns-Knight six-cylinder, chassis, to which four body designs are fitted. An additional innovation is the use of the Gray & Davis combined electric lighting and



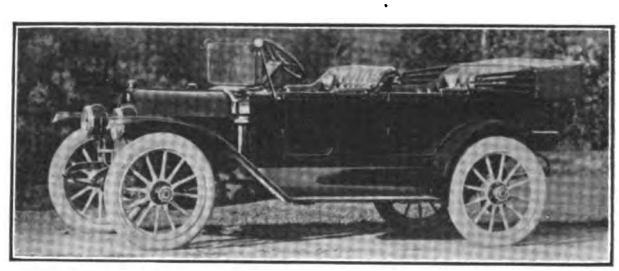
Stearns-Knight Six Seven-Passenger Touring Car.

starting system. The four also has a motor starter, the American Ever Ready mechanical device, while the electric lighting system is the Vesta.

The six-cylinder motor has cylinders cast in pairs, with bore of 4.25 inches and stroke of 5.75, being rated at 43.8 horsepower. Lubrication is by a combined force feed and splash system. Carburetor is a Stromberg. Ignition is by the Mea magneto, dual system. Clutch is a dry multiple disc. Transmission is selective, four forward speeds and reverse. Drive is by shaft to full floating rear axle. Service brakes are contracting and emergency, expanding, both sets on the rear wheel hubs. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 37 by five inches.

MIGHTY MICHIGAN 40.

Designed by W. H. Cameron, the Mighty Michigan 40, made by the Michigan Motor Car Company, Kalamazoo, Mich., is produced in two body styles known as models R and S. The for-



Mighty Michigan 40 Touring Car.

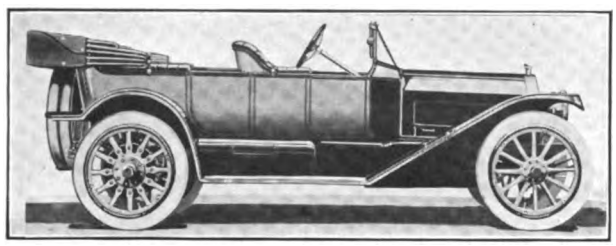
mer is a touring car and the latter a roadster. The chassis is rated at 40 horsepower and presents a number of distinct innovations.

The motor is a four-cycle, water-cooled, four-cylinder unit, cast en bloc, with bore of 4.25 inches and stroke of 5.25. Cylinders are of the L head type with valves located on the right. Lubrication is by combination force feed and splash. Carburetor is a model L Schebler. Ignition is by dual system, Briggs magneto and batteries. Clutch is a leather faced aluminum cone. Transmission is selective, four speeds forward and reverse, direct on the fourth. Final drive is by shaft to full floating rear axle. Service brakes are external contracting and emergency, internal expanding. Springs are semi-elliptic front and three-quarter elliptic rear. Tires are 35 by 4.5 inches.

EMPIRE LITTLE ARISTOCRAT.

The Empire Automobile Company, Indianapolis, Ind., is an entirely new concern, having

Empire Little Aristocrat Five-Passenger Touring Car.



no connection with the old Empire Motor Car Company of that city, and the Empire Little

Aristocrat bears little resemblance to the Empire roadster of a year ago. It is a five-passenger touring car, fitted with every comfort and con-

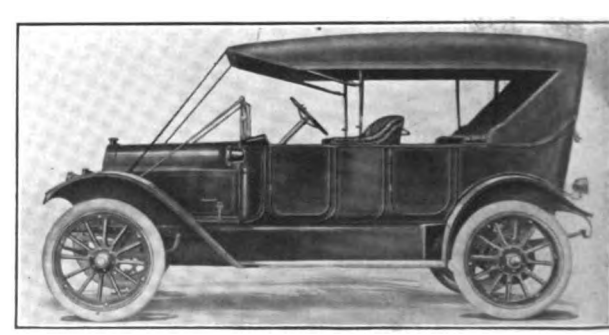
Havers Six-55, Series D Touring Car.

venience considered worthy of its designation.

The motor is of the long stroke type, rated at 25 horsepower. The cylinders are cast in pairs, and the arrangement is that of a unit power plant. Lubrication is by the constant level, force feed system. Ignition is by high-tension magneto, with fixed spark. Clutch is a disc member lined with Raybestos. Transmission is selective, three speeds forward and reverse. Rear axle is of the semi-floating type. Brakes are external contracting and internal expanding. Springs are semi-elliptic front and three-quarter elliptic rear.

Special attention is called to the driver's seat and the space in front of it. There is but one control lever, this being in the centre next to the seat. The ignition being fixed, only the throttle member is on the steering wheel. Four doors are utilized, and these are supplied with handles on the inside.

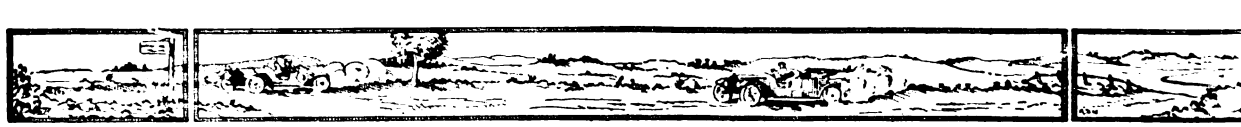
HAVERS SIX-55, SERIES D.



Two body types are added to the series D of the Havers line, made by the Havers Motor Car Company, Port Huron, Mich., a touring car and the Knickerbocker speedster, both fitted to the Six-55 chassis. As is more or less well known the Havers company has been producing six-cylinder models for some time, and the new chassis may be described as a larger six of greater horsepower. Among the new features this year is the utilization of a combined electric starter, ignition and lighting system.

The motor has cylinders cast in pairs, with bore of four inches and stroke of five. Lubrication is a combined system, splash and direct feed. Carburetor is a Stromberg. Clutch is a multiple disc, lined with Raybestos. Transmission is selective, three speeds forward and reverse. Drive is by shaft to full floating rear axle. Service brakes are external contracting and emergency, internal expanding, both equipped with equalizers. Springs are semi-elliptic in front, while the rear has platform suspension. Tires are 36 by four inches.

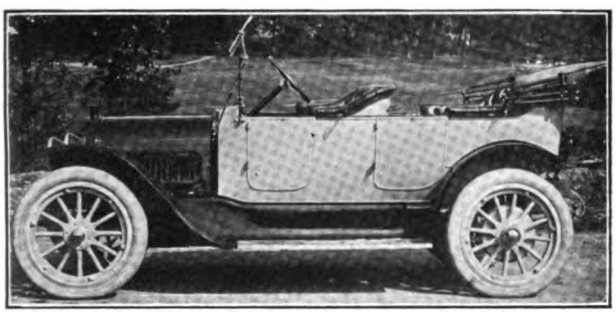
CROW ELKHART MODEL C-6.



In addition to its four-cylinder models the Crow Motor Car Company, Elkhart, Ind., is producing two six-cylinder cars this year, both of which are designated as model C-6. The larger, known as the "big six," is still further distinguished by the letter A, while the "little six" is styled B. The design is the same with each, although of course there is a difference in the size and strength of the parts. Both are equipped with the Deaco electric lighting and starter. The driver is located at the right with centre control levers.

The A motor has bore of 3.75 inches and stroke of five, and is rated at 50 horsepower, while the B has bore of 4.125 inches and stroke of 5.25, and is rated at 60. Both are of the L head type, and the cylinders are cast in pairs. Lu-

Crow Elkhart Model C6 "Little Six."



brication is by splash. Carburetor is a model O Schebler. Ignition is by a dual system, employing the Deaco igniter. Clutch is a multiple disc.

Some New 1913 Models

Transmission is selective, three speeds forward and reverse. Drive is by shaft to full floating rear axle. Both sets of brakes are internal expanding.

Pope-Hartford Model 31 Five-Passenger Touring Car.

Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by four inches on the model A and 37 by 4.5 inches on the model B.

POPE-HARTFORD MODEL 31.

While a number of makers of four-cylinder cars are bringing out new six-cylinder models, it is significant that at least one producer of sixes, the Pope Manufacturing Company, Hartford, Conn., is presenting an entirely new four. This is a 40 horsepower chassis, designated as the Pope-Hartford model 31. Five body types are available, these being a five-passenger touring car, four-passenger phaeton, roadster, limousine and coupe.

The motor is of the long stroke type, the cylinders being cast in pairs. Lubrication is by mechanical oiler. The carburetor is of the Pope company's own make. Ignition is dual, magneto and storage battery. Clutch is a cone member, leather faced with cork inserts. Transmission is selective, four forward speeds and reverse, direct on the fourth. Drive is by shaft to full floating rear axle. Two independent sets of brakes act on the rear wheels. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by 4.5 inches.

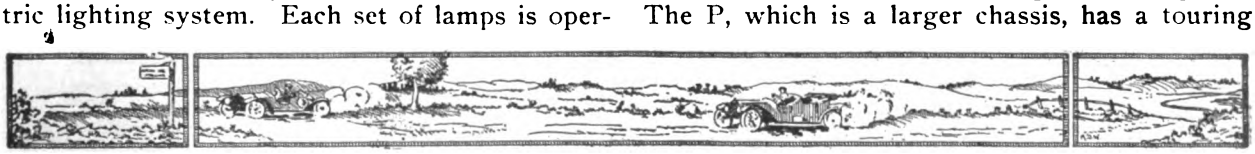
The equipment on all Pope-Hartford models now includes the Gray & Davis starter and electric lighting system. Each set of lamps is operated by a separate switch and electric headlights, side and tail lamps are of the bullet type.

WARREN RESOLUTE.

A notable addition to the line manufactured by the Warren Motor Car Company, Detroit, is the Warren Resolute, a six-cylinder chassis fitted with seven-passenger touring body. Like the other models, the Pilgrim and the Wolverine, both with four-cylinder motors, the equipment is held to be complete in every respect.

The motor is of the Renault L head type, having bore of four inches and stroke of five. Lubrication is by the splash system with gear pump. Carburetor is a Stromberg. Ignition is by Bosch high-tension magneto, with Connecticut distributor and storage battery. Clutch is a leather faced cone. Transmission is selective, three speeds forward and reverse. Drive is by shaft to a floating rear axle, fitted with New Departure bearings. Tires are 36 by 4.5 inches.

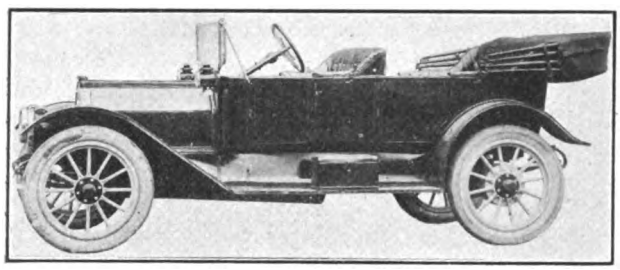
Included in the equipment is a North East combined electric starter and lighting system, electric horn, top, Jiffy curtains, quick detachable demountable rims, etc. The material and workmanship are the same as those which have helped to bring success to Warren four-cylinder cars.



RICHMOND MODEL P.

The Wayne Works, Richmond, Ind., is producing two new Richmond models termed O and

Warren Resolute Seven-Passenger Touring Car.

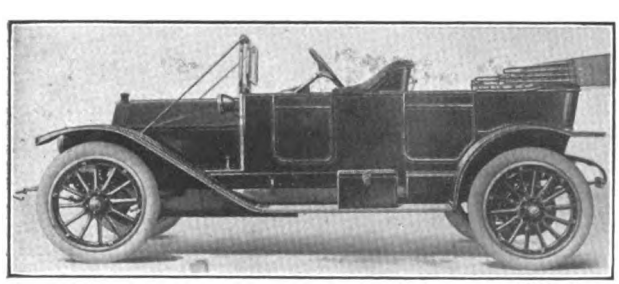


P. The former is fitted with two body types, one a roadster and the other a touring car seating five. The P, which is a larger chassis, has a touring

Digitized by Google

Some New 1913 Models

car body for five. The general constructional features are the same with each, practically the



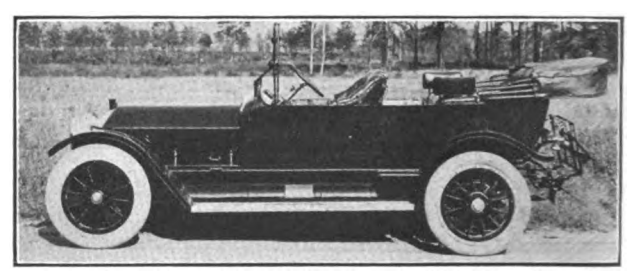
Richmond Model P Five-Passenger Touring Car.

only difference being in the size of the motor, which in the smaller machine is rated at 30 horsepower and has bore of four inches and stroke of 4.5. The equipment includes Jesco starter.

The motor of the model P is rated at 40 horsepower, having bore of 4.5 inches and stroke of five. The cylinders are cast separately and are of the L head type, the valves being on the left side. Lubrication is by splash. Carburetor is a Schebler. Ignition is by Michigan magneto and battery. Clutch is a cone. Transmission is selective, three speeds forward and reverse. Drive is by shaft to semi-floating rear axle. Brakes are internal expanding. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 36 by four inches.

CORBITT MODEL F.

The Corbitt Automobile Company, Henderson, N. C., is presenting the Corbitt models D, E



Corbitt Model F Five-Passenger Touring Car.

and F. They differ only in the seating capacity, the D being a roadster, the E a four-passenger touring car and the F a five-passenger touring. The chassis are the same in every particular. Special features include the use of North East electric lighting and starting system.

The motor is a four-cylinder unit of the L head type with valves at the left. The bore is four inches and the stroke 4.5. Lubrication is by force feed and gravity. Carburetor is a Stromberg. Ignition is by a dual system. Clutch is a multiple disc. Transmission is selective, three speeds forward and reverse. Two sets of brakes are fitted. Rear axle is of the full floating type. Tires are 34 by four inches.

KNOX MODEL 46.

The Knox Automobile Company, Springfield, Mass., also announces a new six-cylinder chassis, rated at 46 horsepower and known as model 46.

Knox Model 46 Six-Passenger Torpedo.

Several body designs are offered, including torpedo, raceabout, limousine and landaulet. In these special attention is drawn to the radiator and hood, the former having a slightly peaked or coned appearance.

The motor has bore of 4.375 inches and stroke of 5.5 and the cylinders are cast in pairs. Lubrication is by the pressure system, utilizing a gear pump. Carburetor is a Rayfield. Ignition is by Bosch magneto and storage battery. Clutch is of the three-plate dry disc type, with the centre plate carrying a series of cork inserts. Transmission is selective with three forward speeds and reverse. Drive is by shaft to full floating rear axle. Both sets of brakes act on the rear wheel hubs. Springs are semi-elliptic in front and three-quarter elliptic in rear. Tires are 38 by five inches in size.

BRITISH ENGINEERS COMING.

Will Return Recent Visit Made by American Society During the Summer.

The invitation of the American Society of Automobile Engineers to the Institution of Automobile Engineers of England, to visit this country next spring has been extended to members of the Society of Motor Manufacturers & Traders, Ltd., and has been accepted by the latter. It is expected that the party visiting the United States from England will be greatly augmented as a result. A joint committee of the two English bodies is at work on the preparation of the programme, which will be full of interest.

A number of automobile factories will be visited, together with works producing steel, springs, tires, bodies and other details of the automobile industry, while three days will be passed on one of the largest passenger steamers of the Great Lakes during the annual summer meeting of the American Society of Automobile Engineers.

FIRST CAR OWNED IN LYNN.

Now on Exhibit Beside Latest Chalmers Model in Whitten's New Salesroom.

Readers of The Automobile Journal remember that the gasoline automobile designed by Max Hertel won a prize for starting from the seat at the Chicago Times-Herald race of Thanksgiving Day, 1895. This machine was later built as the Oakman by the Oakman Automobile Company, Greenfield, Mass. It appears that one of these was purchased by F. C. Cheever of Lynn, Mass., Nov. 10, 1899, and was the first automobile owned in Lynn. At present this car is on exhibition in the new salesroom of Charles E. Whitten, the Chalmers agent on Central avenue in that city.

Mr. Cheever supplies some interesting data concerning the car while it was in his possession. For instance, it appears that he paid $650 for it Nov. 10, 1899, and sold it July 27, 1901, for $350. That gives a depreciation of $300. He expended $50.24 for repairs, overhaul, new parts and labor; $17.76 for tires; $21.65 for gasoline, oil and batteries, and $25.35 for improvements, etc., making a total running expense of $115. He ran the car a total distance of 1625 miles, and the cost a mile figures out at about 25.5 cents.

After Mr. Cheever sold the machine it passed to at least two other owners, but he finally bought it again, to retain it as a curiosity and because of the sentiment associated with its original ownership.

PREFERS MOTZ CUSHION TIRES.

Lady Beresford Specifies This Equipment on Her New Grinnell Electric Car.

An accompanying illustration presents Lady Beresford, sister-in-law of Lord Decies, who married Miss Vivian Gould of New York City, and her new Grinnell electric car, made by the Grinnell Electric Car Company, Detroit. Lady Beresford is quite as well known as Miss Kitty Gordon, star in Victor Herbert's latest operatic success, "The Enchantress."

As is true with many makers of electric and gasoline pleasure cars, the prospective purchasers of Grinnells are invited to specify the make of tires which shall be fitted. Lady Beresford selected the Motz cushion tire, made by the Motz Tire & Rubber Company, Akron, O. This choice was based upon the company's claim that this type of tire offers all the resiliency of a pneumatic, without the possibility of a puncture. Naturally, this is an argument which may be expected to make its appeal to women drivers, and Lady Beresford contemplates driving her own machine.

Lady Beresford and Her New Grinnell Electric, Fitted with Motz Cushion Tires.

R. M. Owen & Co., 19 West 62nd street, New York City, has issued the annual Christmas number of the Reo Echo, a handsome 48-page brochure. Besides the 1913 Reo announcement it contains stories and anecdotes on motoring by well known automobile writers, all of which are illustrated. A copy will be mailed to those interested upon request.

CONCERNING THE NEW MODELS.

Sufficient has been revealed with respect to the new models which will be displayed at New York, to indicate some of the general tendencies for the 1913 season. It may be argued that many of these models have been in the market for months, but despite such announcement on the part of several makers, it is significant that a large number of absolutely new machines will be disclosed at the show.

There was disposition to presuppose at one time that 1913 was to be a six-cylinder year. It will be found that several makers who have been devoting their sole attention to four-cylinder cars in the past have brought out sixes, but on the other hand some makers of sixes are presenting new fours. And it will be noted that practically all of these concerns are continuing their fours in connection with the new sixes. It hardly will be contended that the six has entirely superseded the four by any means.

Those who visited the shows last year were impressed by the number of cars regularly fitted with some type of electric lighting system. The subject of motor starters was decidedly prominent, but the number of electric starters was comparatively limited. This year it will be found that a large percentage of cars are fitted with both starters and electric lighting, and in many instances it will be noted that the equipment is a combined unit. The subject perhaps may still be regarded as one which is not definitely settled upon, but the statement is made as indicating the trend of the industry along this line.

Another noticeable feature this year is the fitting of a large number of accessories, which the purchaser was required to obtain a few years ago. The suggestion that 1913 is to be a full equipment year may be based upon the statements of the manufacturers themselves. It is worthy of comment that in many instances the purchaser is given liberal options in the matter of equipment, this applying most particularly to tires and rims.

Wire wheels, the Knight motor and other non-poppet valve types, left hand drive, centre control levers, four real doors, attractive body lines, convenient location of control members on the dash, etc., are all matters which will be observed by the show visitor. There are many new features to be given consideration in making decision, but there are few indeed which have not demonstrated their thorough practicability under exhaustive tests.

PROGRESS REVEALED BY SHOW.

Thirteen years ago the first organized automobile show, in any manner approaching a national display of a separate industry, was held in Madison Square Garden, New York City. Insofar as the gasoline road vehicle was concerned, the first successful American type had appeared nine years previous to that event. Steam and electric machines were decidedly more numerous during that initial exhibition.

Few of those who will visit Madison Square Garden and Grand Central Palace during the 13th national show this month will be disposed to dwell upon the past. They will be far more interested in the present and future, particularly with reference to offerings of the car and accessory manufacturers. But it is of undoubted value to look backward as well as forward when it is possible to measure progress thereby.

Digitized by Google

Thirteen years ago, having in mind the gasoline machines, the features of the show were the car that had been driven from Cleveland, O., to New York City, and the one which was run down over the road from Boston expressly for the display. So great was the demand for actual demonstration that some of the space which could not be utilized for exhibition purposes was converted into a race track, and a test hill was erected on the roof of the building.

Last year there were exported from the United States to foreign countries, automobiles and parts thereof estimated at some $28,000,000 in value. The exact figures for the first 10 months of the year were $23,772,221. The last governmental census showed an annual business of $165,000,000, and there will be no disputing the proposition that the business of the industry has increased materially since that time. Since the close of the 19th century the industry has grown from insignificant proportions until it occupies one of the most important places in the industrial activities of the nation.

The New York show, occupying two of the largest buildings in the country, will reflect this remarkable progress in every way. For the first time in several years, the product of the entire industry will be on exhibition under one management. The public will have full opportunity to inspect the offerings and judge of their merit.

BUSINESS MAN'S OPPORTUNITY.

The business man, who is at all interested in the subject of the mechanical transport, should arrange his plans so as to spend at least a portion of the week of Jan. 20-25 in New York City. The big double display of motor trucks in Madison Square Garden and Grand Central Palace will afford the best opportunity that ever has been presented in the East to study the features of the various products and to make comparison of their respective merits.

The commercial vehicle end of the industry is still regarded by some as in its infancy, and to such the forthcoming show will prove a decided revelation. The manufacturers have made every endeavor to solve the problems as fast as they have presented themselves, and in many instances they have been able to meet the proposition before the problem really existed. As a result, the business man has but to state his needs and the transportation engineer will be able to co-operate with him in securing the proper installation.

There will be a number of new trucks on display, but it is impossible to forecast the features, as with pleasure cars. Several new concerns have entered the industry since the last show season, although perhaps it would be better to state that they have announced their product, since practically all of these have been experimenting under exhaustive tests for months, and in some instances years, before making public announcement. These new vehicles, as well as the new models of the older companies, will merit serious investigation.

THE ACCESSORY DISPLAY.

Despite the statement that this is to be an equipment year, the accessory booths will still offer much of interest to the motorist. The mere fact that car manufacturers are offering options in the matter of fittings is an indication of the importance of the subject.

In addition there are a number of entirely new devices which will be revealed at this time. As with the cars and trucks, these have been subjected to extended tests and are held to be practical in every respect by their makers. This applies as well to supplies, parts and fittings, which cannot be called accessories in the strict use of the term, but usually are included as such.

WATCHING THE LEGISLATORS.

This month nearly all of the state legislatures begin their annual or biennial sittings. Already there is indication that a large amount of their time will be devoted to subjects affecting motoring and motorists. It is particularly interesting to note that local clubs are taking a decidedly more active part in this matter than in any previous year, and this should result in decided benefit to the industry as a whole.

Just at present little will be done except to file bills and refer them to the proper committees. The real work will come in the future, when these committees will hold hearings and formulate the acts upon which decision will be made. Motorists will do well to watch the list of new business, and make note of what the legislators will be called upon to consider.

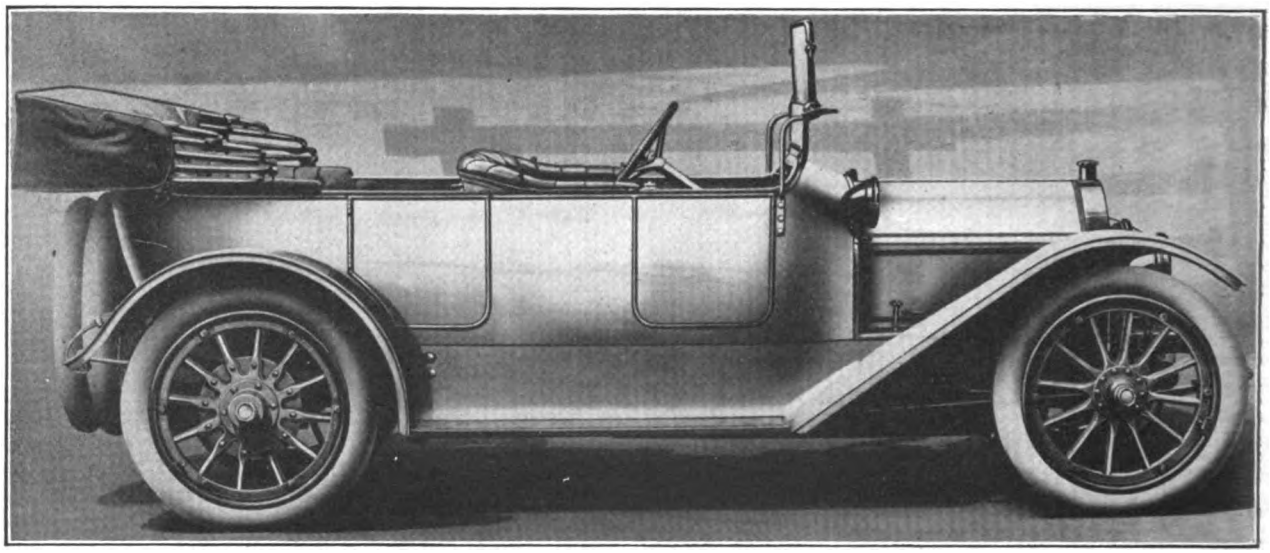
Eleven hundred miles of roads in the desert country to the northeast of Los Angeles county, California, have been charted by the Automobile Club of Southern California. The work is being done under the direction of O. K. Parker, engineer of the club, and is the first installment of about 5000 miles of the desert roads on which signs are to be posted by the automobile club. In addition to the main route, which follows the Santa Fe tracks into northern Arizona, Mr. Parker covered all the desert country south on the California side of the Colorado river through to Palo Verde valley. He then crossed the Chuckawalla desert into Mecca and returned along the Ocean-to-Ocean highway.



Mr. and Mrs. Frank Robertson of Portland, Ore., recently visited the factory of the Pope Manufacturing Company, Hartford, Conn., maker of Pope-Hartford cars, in a machine of that make that had carried them about 18,000 miles through India, Europe and the British Isles. With them they brought back unopened a package of spare parts which was made up for them at the Pope factory over a year ago, when they took delivery of the car.

A Baker electric, made by the Baker Electric Vehicle Company, Cleveland, O., recently accomplished the 134-mile run between Los Angeles and San Diego, Cal., over the mountainous pass on the El Camino Real. This was the first time in history that the trip was made by an electric. The running time was exactly 10 hours. This is considered good time for gasoline cars, as Tory Pine is one of the longest hills in California.

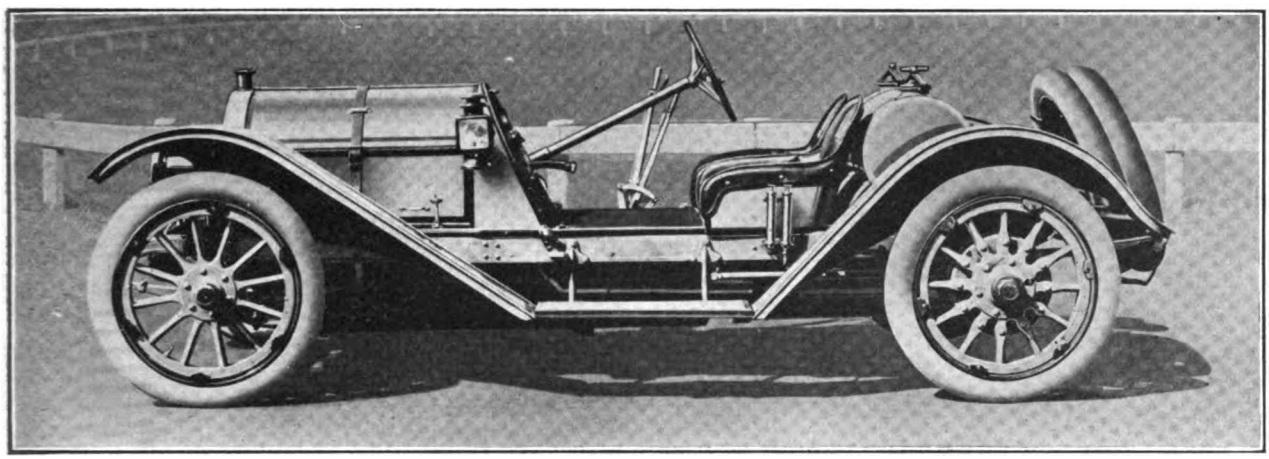
NEW MERCER SERIES INCLUDES TWO CHASSIS.

ANNOUNCEMENT is made of a new series by the Mercer Automobile Company, Trenton, N. J., comprising two distinct chassis. To one is fitted four and five-passenger bodies, designated as type 35, series G and H models. The second chassis is equipped with roadster types of bodies and will be known as series J and K, the former being the well known raceabout which has established an enviable reputation in speed contests during the past year, while the model K is a runabout of the fore door design having distinctive and attractive lines. With the exception of minor changes, these being in the nature of refinements, the new series is similar to that preceding it. There has been no change in the motor, its stability and high efficiency having been amply demonstrated in numerous road and track events, as well as in every day service. Both chassis are now equipped with a four-speed transmission and separate electric lighting and motor starting units, these being standard equipment on all models with the exception of the raceabout.

Model H of the Mercer New Series, a Five-Passenger Touring Car with Complete Equipment, Including Electric Lighting and Electric Motor Starter.



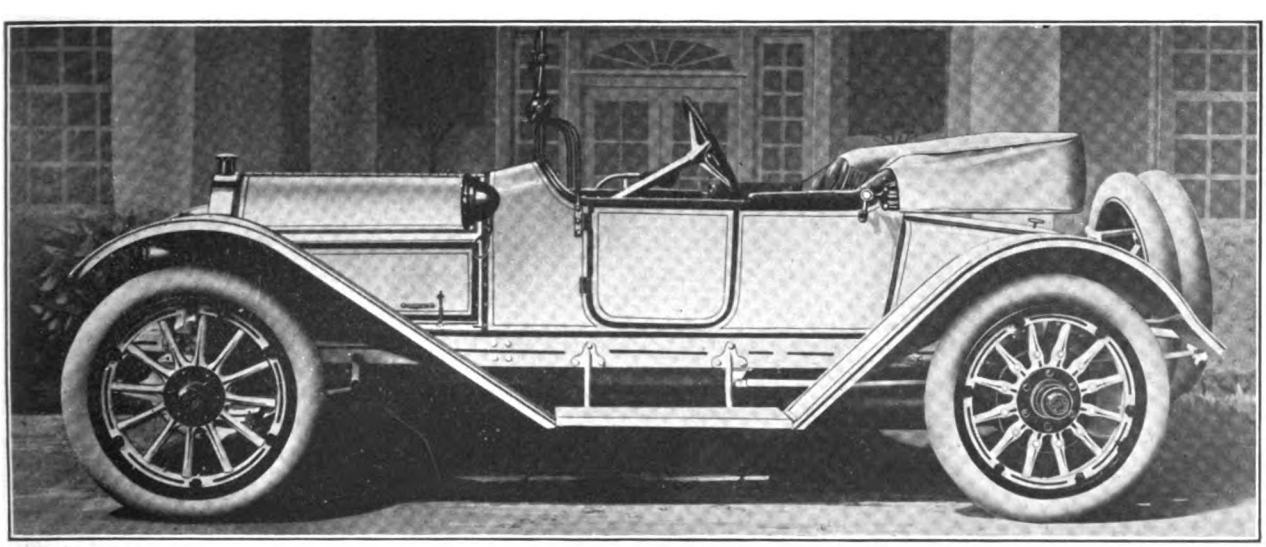
The motor of the Mercer chassis is of particular interest because of its construction which permits of exceptional power and high speed possibilities. That of the model G and H is a four-cylinder unit, having a 4.5-inch bore and five-inch stroke, conservatively rated at 32.4 horsepower by the S. A. E. formula, but must show a dynamometer pull of 58 at 1700 revolutions a minute before passing inspection. The bore to stroke ratio is 1:1.11, and piston displacement, 320 cubic inches. The motor of the other chassis has a bore of 4.375 inches and stroke of five, and is subjected to the same test for horsepower as the larger unit. This exceptional power is accredited to the generous size of the valves and their lift, but there are other factors in the design making for high efficiency.

Large Sized Valves.

As both motors are similar with the exception of the bore and stroke, the description of that utilized with models G and H will serve. The unit is of the four-cycle type with T head cylinders cast in pairs of a special grade of gray iron, and the machining and grinding process is accurately performed and subject to rigid inspection. The water jackets are cast integral, are ample in size and special attention has been paid to the cooling spaces about the exhaust valves.

The valves are large, being 2.5 inches in diameter, and have a lift of .4375 inch, the intake members being located on the right and exhaust on the left of the motor. The heads are of a high grade nickel steel with carbon steel stems, being welded and riveted in a special die. The clearance is .002-inch and an intermediate arm, having a pivoted bearing, is arranged between the cam and the valve lifter, eliminating opportunity of any side thrust. The guides are of cast iron and the adjustable tappets are of a high grade steel, carefully ground to size. The valve mechanism is not enclosed.

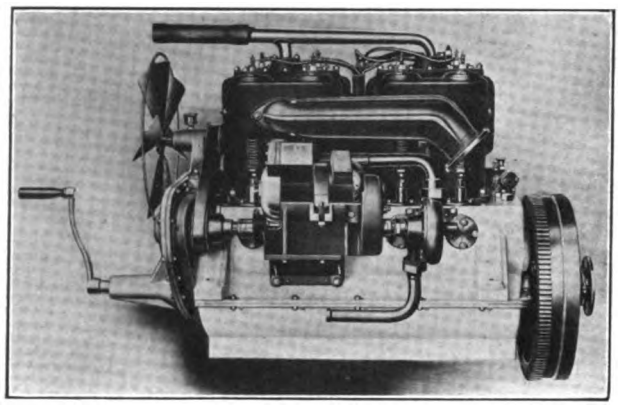
Digitized by Google



Model J Raceabout Which Made a Creditable Showing in Road and Track Contests During the Past Year—Low Centre of Gravity Is Due to Frame Design.

The pistons of the Mercer differ from conventional practise in that only two rings are utilized, but the company points out that the design and method of fitting these members is one of the factors entering into the efficiency of the motor. Instead of the rings being turned eccentric they are the same thickness all the way around, then peined in a special machine which automatically provides an even tension at all points. In addition to improving the compression the construction makes for a lighter piston which is of cast iron ground to size. The wristpins are hollow, of an alloy steel, hardened and ground, and oscillate in bosses.

The connecting rods are drop forged of nickel steel, are 12.5 inches in length, centre to centre, and it is held that the lack of vibration in the Mercer motor is due to the length of the rod, and that each set of pistons and rods is exactly of the same weight. The connecting rod is clamped to the wristpin, while the large end is of the split type, retained by four bolts. The bearings consist of an outer shell of bronze lined with Parsons' white brass and are liberal in size as will be noted in an accompanying illustration.



The crankshaft is of chrome nickel steel, two inches in diameter, a drop forging accurately ground to size. It is provided with three large bearings, these being 3.5, three and four inches, respectively, and is anchored by bolts through the upper section of the crankcase. The materials of which the bearing is made are bronze and Parsons' white brass.

The camshafts are drop forgings of nickel steel, ground to 1.25 inches diameter with cams integral. They rotate in three bearings, the for-

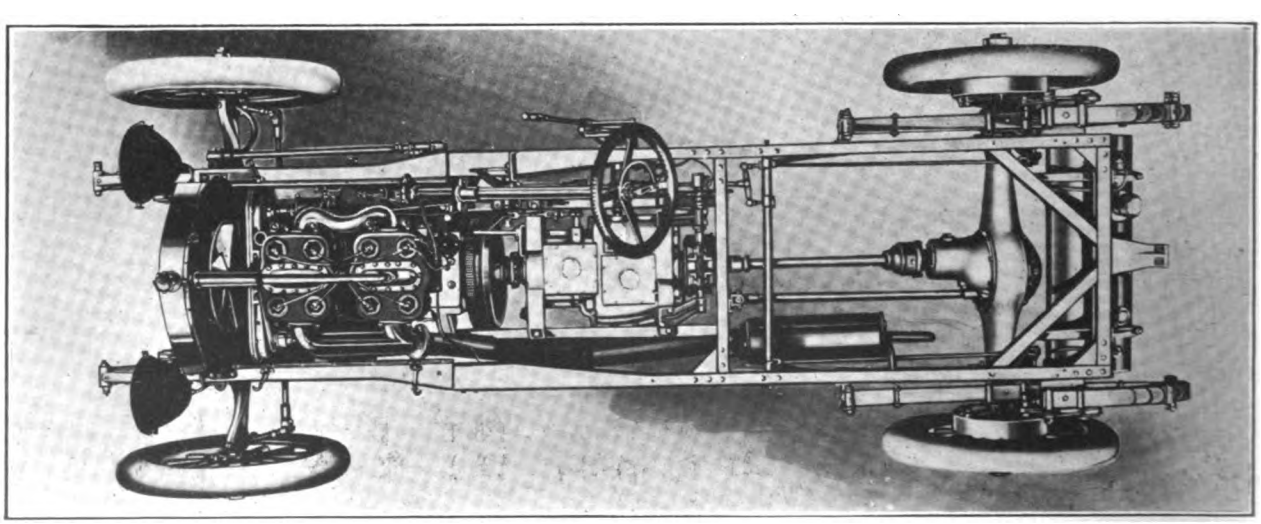
Model K Mercer, Two-Passenger Runabout of Attractive Lines, Having Deep Upholstery and Conveniences Making for Comfort.

Digitized by Google

Exhaust Side of Mercer Motor, Showing Pump Driven Through Lighting Dynamo Shaft and Method of Mounting the Generator.

ward being ball and rear plain. Although housed in the base the camshafts may be removed from the forward end of the motor. Each cam is accessible through an inspection plate in the upper section of the crankcase. Each camshaft is actuated by a manganese bronze spiral gear of 1.25-inch face and meshes with steel members making for noiseless operation as well as accuracy in timing.

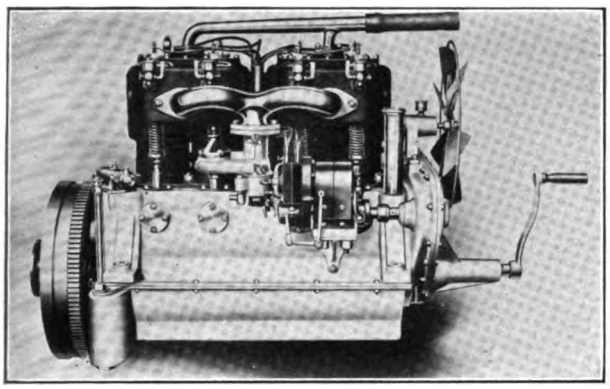
Lubrication.



The crankcase is an aluminum alloy, divided at the main bearing line, and the lower section carries the oil reservoir in its base. Lubrication is by pressure feed and splash, a constant level being maintained by a gear driven force feed rotary pump having but one moving part and being located in the oil reservoir. Oil is drawn from the sump and forced through a sight feed on the dash, thence to the three main bearings from which it overflows, and is carried by centrifugal force along the crank throws, where small aluminum scoops gather it and distribute it through the drilled crankshafts to the centre of the connecting rod bearings. This insures each bearing receiving proper lubrication and the filtering of the oil eliminates foreign elements which if existing would be washed out by the flow of the lubricant.

The camshaft bearings, timing gears, cylinder walls and all working parts are lubricated from the splash of oil in the crankcase and the constant level is secured through overflow dams located in the crankcase proper between each cylinder. Vents maintained at a correct level in the overflow dams permit all surplus oil to be returned to the reservoir. The oil indicating device comprises a small cork float attached to a hollow calibrated rod. These members are contained within a brass casing having a removable cap, the displacement of which permits the float to rise and denote the amount of lubricant in the reservoir. The oil capacity is 1.75 gallons.

Carburetion is by a float feed Fletcher located on the right of motor, and it is noticeable that the mixture has but a short distance to travel to the combustion chambers and that the design of the intake manifold is very compact, a quality making for easy starting and eliminating the condensation of the gas. The exhaust manifold, as well as the pipe conveying the burnt products to the muffler, is of generous size, reducing back pressure to a minimum through the ample space for the expansion of the gases.



Two-Spark Magneto.

Ignition is by a Z R 4 independent, two-spark Bosch magneto of the enclosed water proof type, located on the intake side of the motor and gear

Plan View of the Mercer Chassis, Constructed in Two Types but Utilizing Same Design of Motor.

Digitized by Google

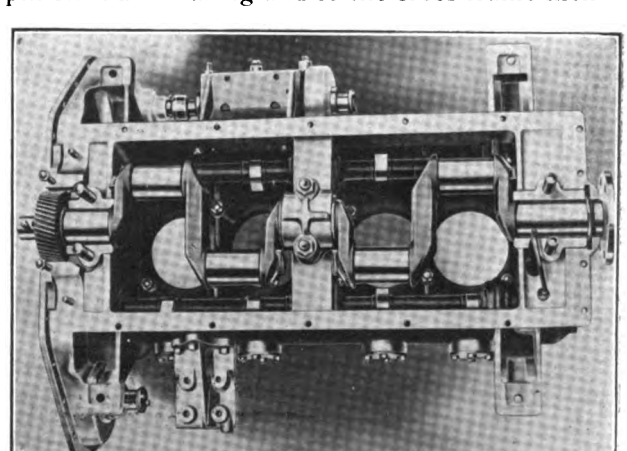
Intake Side of Mercer Motor, Presenting Oil Indicating Device, Compact Intake Manifold and Two-Spark Magneto.

driven. Two sets of plugs are utilized, one over the intake and the second over the exhaust, and both are fired simultaneously. The advantages of dual sparks are well known. Control is by a two point switch, permitting the use of one or both sets of plugs as desired.

The importance of cooling has been given careful attention in the Mercer motor and the temperature of the cylinders is held to a predetermined value irrespective of conditions of service or motor speeds. The cooled fluid is taken from the radiator by a large centrifugal gear driven pump located on the left hand side of the motor, enters the jackets directly under the exhaust valves, and after circulating through the cooling spaces passes out through the outlet manifold on the top of the cylinders. Both manifolds are of copper, of liberal size, and the cylinder members are of the removable type. The radiator is a square tube, cellular member, supported on the main frame by ball and socket joints, eliminating stresses, and its capacity is four gallons. Cooling is further aided by a belt driven fan mounted on annular ball bearings and adjustable.

The shaft actuating the pump is mounted on annular ball bearings and between it and the fan pulley is located the lighting dynamo, which is shaft driven. An extension of the generator shaft is fitted with an Oldham coupling which actuates the pump shaft. These units may be dismounted readily and without interfering with each other.

Priming cups are fitted to the intake side of the motor between which the high-tension cables are carried in a tubing, preventing opportunity of short circuits through chafing. The timing gears are accessible by removing a large sized plate with which the starting crank support is integral. A large breather, also serving as an oil filler, is fitted on the right hand side of the upper crankcase in a very convenient position.



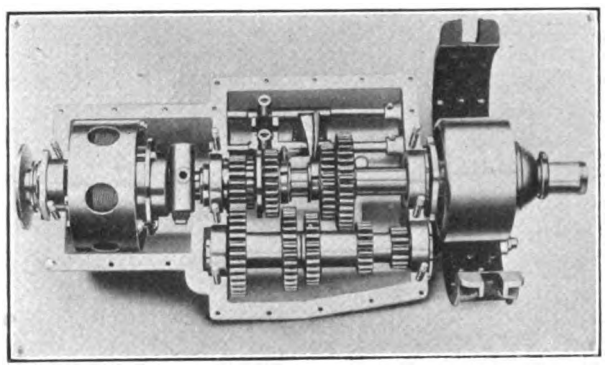
Unit Clutch and Transmission.

The multiple disc clutch and the selective type of transmission are a unit and the housing is suspended in a four point sub-frame. The transmission design is such that by removing the bolts holding the two sections the lower half, containing the clutch, gears, etc., may be removed without disturbing the alignment.

All gears and shafts are forged from a high grade chrome nickel steel having a tensile strength of 300,000 pounds to the square inch, oil tempered, and the gears have an 1.125-inch face. The shafts are ample in size and rotate on D. W. F. annular ball bearings. A compensating joint is fitted between the clutch and the motor and the former comprises 44 steel-to-steel plates running in a bath of oil. The clutch bearings are of the annular ball type and thrust members are incorporated.

Full Floating Rear Axle.

Drive is through an ample sized shaft of chrome nickel steel and a spring type of universal joint is fitted between the motor and clutch unit, and two between the transmission and rear axle. The rear axle is of the full floating type, the driving axles being of 1.25-inch chrome nickel steel with integral jaw clutches. They rotate on annular ball bearings as does the differential unit, the gears of which are of chrome nickel steel. The pinion shaft is also of chrome nickel steel mounted on annular ball bearings and is contained within a separate housing securing the differential casing, a construction making for accessibility. The differential and axle shaft housing is of pressed steel and the gears are accessible by means of a large inspection plate immediately at the rear. The torsion member is placed at the left of the drive shaft, being secured to the pinion shaft housing and to the cross frame mem-



Bottom View of Mercer Crankcase, Depicting Liberal Size of Crankshaft and Bearings.

Digitized by Google

ber back of the transmission. The radius rods are sturdily constructed.

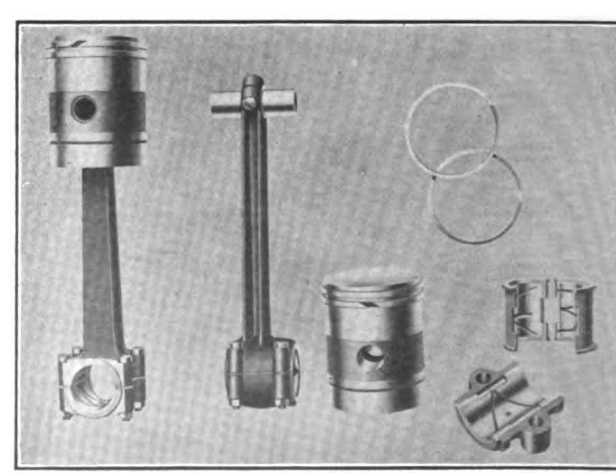
The frame is of pressed steel, channel section

Illustrating the Four-Speed Selective Type Mercer Transmission and Contracting Transmission Service Brake.

type, having a thickness of .125 inch with depth of channel 4.5 inches, and is narrowed in front to provide a short turning radius. It is kicked-up in the rear 3.5 inches, making for the low centre of gravity noticeable of the Mercer cars. The springs are semi-elliptic in front and three-quarter elliptic rear, with drop forged spring hangers and ample sized grease cups.

Front Axle.

The front axle is of the I beam section type, a drop forging of nickel steel, and the front wheels and steering spindles are all mounted on annular ball bearings. The yokes are of the Elliott type. The tiebar and drag link are constructed of chrome nickel steel and the former is located back of the axle. The steering gear is of the semi-irreversible worm and gear type and the worm and gear are of high grade steel, carefully hardened and adjusted for wear. The design is a Mercer and lubrication is provided by packing all parts in grease. The steering column is set at an angle of 42 degrees and the hard rubber corrugated wheel is 17 inches in diameter mounted on an aluminum spider. The gas and spark controls are located on the wheel.



Right hand control is employed, with clutch pedal at left and brake member at right. The accelerator is at the right of the brake pedal and the speed change lever is within the body at the right, as also is the emergency lever. Two sets of brakes are provided, the emergency members being of the internal expanding type located on the rear wheels and having 14-inch diameter and 2.25-inch face. The service brake is of the transmission type operating on a drum bolted to the driving shaft directly back of the gearcase. With this type of brake the maker holds that an absolutely braking effect is applied through the differential to both rear wheels and that the car can be brought to a quick stop without a tendency to skid. The brake comprises two cast iron shoes faced with an asbestos fabric. They are contracted by means of a right and left worm and are easily adjusted for wear. The diameter is nine inches and the face four, providing liberal friction surface.

The wheels are of the artillery type, of carefully selected wood, and annular ball bearings are employed. They are fitted with 34 by four-inch tires, both front and rear, and the rims are of the quick detachable demountable type. Two extra rims are standard equipment. The wheelbase is 118 inches and tread 56.5.

Pressure feed is utilized on models G, H and K, the fuel tank being swung under the chassis at the rear and having a capacity of 18 gallons. The air pressure is maintained by a gear driven pump. The tank of the raceabout is placed directly back of the seats, forming a part of the rear deck and has a capacity of 26 gallons. A compartment for oil and enabling the storing of five gallons of lubricant also is included.

Attractive Body Designs.

The body designs are attractive and are noticeable for their straight lines and deep upholstery. The seats on both models G and H are 22 inches deep from front to rear and the cushion is nine inches thick, sloping slightly to the rear with a depth of about 4.5 inches at this point. Deep coil springs are used in the backs of the seats and in the lower part of the cushions. In the model G the emergency and gear shift levers

Showing the Piston and Connecting Rod Assembly—The Piston Is Fitted with Two Concentric Rings Peined by a Special Process.

are on the outside of the body and because of its wind resisting design it is capable of high speeds. Model H is a five-passenger car, designed for

Digitized by Google

family use, and the body is much wider than model G. The control levers are located within the body. The standard colors of the touring cars are green, red, blue and brown.

The runabout, model K, has an enclosed fore door body with tufted upholstery and deep cushions. The rear deck provides an ample sized baggage carrying compartment and the space is sufficiently large to accommodate two good sized suitcases. The raceabout is a two-passenger car, with a guaranteed speed of one mile in 51 seconds.

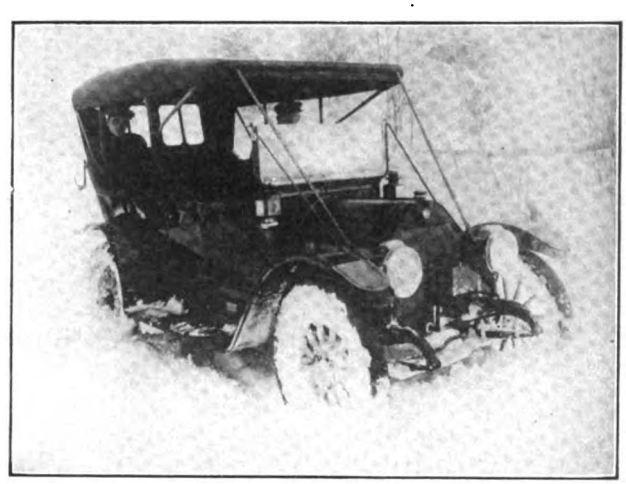
All models, with the exception of the raceabout, are fitted with electric lighting and a motor starter. The units are separate, the dynamo being a Rushmore, made by the Rushmore Dynamo Works, Plainfield, N. J., and the battery is floated upon the line, the generator maintaining the cells in a properly charged condition. The motor starter also is a Rushmore and energy is imparted to the flywheel of the engine through a gear meshing with teeth cut on the periphery of the flywheel. The starter is located on the left hand side of the motor on the main and subframe. Current is supplied from the storage battery.

The equipment is very complete and includes a four-bow mohair top, side curtains, dust cover, horn, tire holders, two extra rims, robe rail, foot rail, tool box, pump, tire repair kit, jack and a full set of tools. Truffault-Hartford shock absorbers, made by the Hartford Suspension Company, Jersey City, N. J., are included as standard.

The new series cars will meet the approval of those who desire a serviceable machine having ample power and accommodation to meet all requirements. The construction is in every way substantial and the best of workmanship and material is incorporated throughout.

GOODYEAR BANQUET AND DANCE.

Company and Employees Celebrate Opening of New Administration Building.



The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, recently gave a banquet and dance to its employees to celebrate the official opening of its new administration building. The remarkable growth of the company the past few years seemed to warrant an unusual celebration and the Goodyear company took proper advantage of the opportunity.

A beautiful programme, in the form of a booklet containing excellent half-tone reproductions of the officials and employees of the company and of the buildings, interior offices and workrooms, was presented to each guest. In addition, it gave a history of the company and its rapid rise in the commercial world. In the centre of the book was printed the menu, while on the opposite page was the dance order, consisting of 18 numbers. The booklet was bound in heavy material, the front page being surrounded with a border in gold, while the name of the firm and the dates "1898-1912," were also printed in gold.

WINTER MOTORING IN REO.

New Self-Starting, Four-Cylinder Model Experiences No Difficulty in Snow.

The latest Reo the Fifth, made by the Reo Motor Car Company, Lansing, Mich., and sold through R. M. Owen & Co., general distributor, New York City, has had its first test in the snows of Westchester county, just outside the Metropolis. The experiment was a success in every sense of the word.

Latest Reo the Fifth Negotiating Snow in Westchester County, New York State.

There is considerable rivalry each year among New York motorists to see who shall be the first to drive a new car over the snow filled roads of Westchester county. Usually the Reo secures the coveted honor, and December, 1912, was no exception to the rule. Since winter motoring has become thoroughly established, ability to plow through deep snow is a decided factor in the popularity of the car, particularly in New York City.

The new Reo the Fifth is a 30-35 horsepower, five-passenger, four-cylinder touring car, fitted with self-starter, electric lighting and all the modern improvements. It is capable of 55 miles an hour, although this rating is subject to slight amendment under the conditions obtaining in the accompanying illustration.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

The Vim Motor Starter, marketed by the Vim Manufacturing Company, Cleveland, O., is of the acetylene type, priming the cylinders with a proper mixture of the gas and air, the explosive vapor being fired by the ignition spark. The acetylene is led from the tank to the dash, thence to the intake manifold of the motor and the control unit is of special construction. This not only is operated easily from the seat, but it is held by the maker that it is impossible for the acetylene to leak. The dash device is very neat, comprising a numbered dial and a lever. By moving the latter to the proper number the desired mixture is secured. The Vim motor starter is very compact, weighs slightly over a pound, and the maker states it may be fitted in 30 minutes.

—— ★ ——

The National Power Tire Pump, manufactured by the National Motor Supply Company, Cleveland, O., is a compact unit and is fitted in the spark plug opening of the cylinder. The design is such that it will operate equally well on small or large motors and will inflate the largest tire in a very short time. The National takes in and pumps fresh air to the shoes, by means of an inlet and outlet valve, these being actuated by a leak proof piston. An air receiving chamber is located between the outlet valve and tubing for the purpose of storing the compressed air and allowing it to flow gradually during the downward stroke of the piston. The rubber tubing is 12 feet long, covered with woven cloth, and a pressure indicator is fitted. Special connections are utilized. High grade material and workmanship are incorporated.

Vim Motor Starter

National Power Tire Pump

Shurecleen Strainer

Gardner Visible Carburetor

Shaler Vul-Kit

The Shurecleen Strainer is produced by the Bingham Manufacturing Company, Cleveland, O., and is a compact device for separating water and foreign elements from the fuel. It is designed for attachment in the main line between the supply tank and the carburetor and differs from those of conventional practise in that three petcocks are fitted. One controls the flow of liquid to the filter, the second shuts off the fuel to the carburetor and the third is utilized for removing all accumulations or for drawing off gasoline if desired. The device is moderately priced.

—— ★ ——

The Gardner Visible Carburetor is the product of the Gardner Carburetor & Brass Works, Shreveport, La., and differs from those of ordinary construction in that springs are eliminated. A feature of the device is that its action is visible, the mixing taking place in a row of graduated glass tubes on the dash in plain view of the driver. Each mixing tube has a separate nozzle and needle valve for controlling the flow of gasoline, and the effect of the adjustment is indicated. By utilizing several mixing tubes it is held that greater flexibility is possible, as well as economy of fuel. Heated air is utilized and a fluid gauge is part of the equipment.

—— ★ ——

The Shaler Vul-Kit has been brought out by C. A. Shaler, Waupun, Wis., to meet the demand for an efficient, low priced vulcanizer of the automatic type. Its simplicity of operation will appeal to motorists not familiar with repairing inner tubes as all that is necessary is to fill the puncture with new rubber, clamp

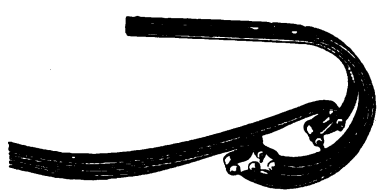
Digitized by Google

down the vulcanizer, fill and light the generator. The latter is supplied with gasoline which when ignited, automatically produces the proper temperature for curing the rubber. A universal clamp insures proper pressure and a special handle permits of removing the vulcanizer when hot without danger of injury to the operator.

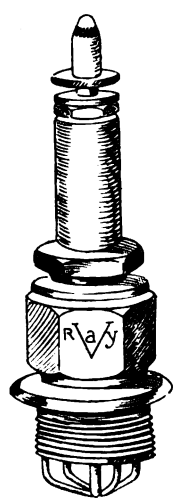
—— ★ ——

The Apex Radiator Cleanser is produced by the United States Compound Company, Buffalo, N. Y., and by placing a small quantity in the cooler and allowing it to remain about a week, all scale, etc., is dissolved. The water is drawn off to remove the foreign elements and a slight amount of the cleanser added to the fresh supply. This keeps the radiator in a clean and efficient condition and prevents injury through the use of hard water.

—— ★ ——

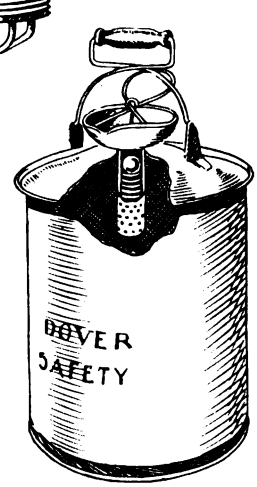


The Huston Multiple C Spring is produced by the Huston Multiple C Spring Company, Philadelphia, and replaces one of the usual members. It comprises a number of proportioned scrolls, and the main member is supported from the top plate of the supporting spring by a pivoted compensator which equalizes the constantly varying strain among the three leaves. The latter are separated from one another and operated independently. It is held that the device not only makes for easier riding qualities of the car, but eliminates opportunity of spring breakage when traversing rough roads. Economy of tires and better traction are also emphasized in the device.



—— ★ ——

The V-Ray Mica-Lava Plug, is a new product of the V-Ray Company, Marshalltown, Ia., and a quality emphasized by the maker is that there is no chamber or recess in the shell exposed in the cylinder to attract carbon or soot. The solid block of flint like lava issues from the solid lower part of the steel shell without the customary chamber. The lava is practically indestructible and it is held that the plug may be thrown on a stone floor without injury. The only mica employed is not exposed to the heat and protrudes above the top of the plug. A feature is the utilization of six cylindrical layers of the material around the centre stem before the mica washers are fitted. The terminal cap fits all cable members and has a unique self-cleaning feature. The electrodes are of uniform length and will fit the valve clearance in any motor. The plug is made in four sizes, .5-inch standard, metric, .875-inch A. L. A. M., and standard motorcycle.



Apex Radiator Cleanser

Huston Multiple C Spring

V-Ray Spark Plug

Dover Safety Fuel Can

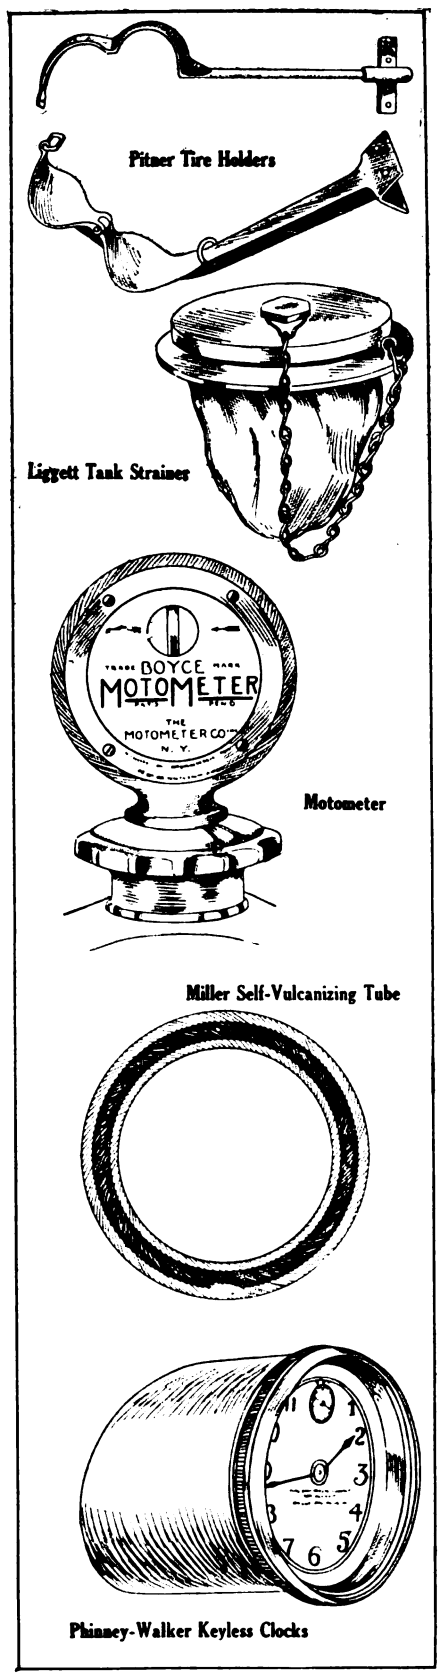
—— ★ ——

The Dover Safety Gasoline Can is a new product of the Dover Stamping & Manufacturing Company, Cambridge, Mass., and among its practical qualities is a self-closing feature which prevents the evaporation of the fuel, as well as eliminates opportunity of explosions. The device comprises a large brass ball ground into a valve and normally held closed by a spring. The valve member is surrounded by a gauze chamber, preventing fire reaching the vapor or contents of the can when pouring or filling. In the five-gallon size the valve opens and closes automatically when pouring, but cannot open accidentally. On the one-gallon and one-quart sizes the valve is held open by a slight pressure of the thumb, closing when released. The

Digitized by Google

cans are constructed of heavy galvanized steel, painted red and stencilled "Gasoline." Economy of fuel is effected by the air tight qualities. The containers are moderately priced.

—— ★ ——



The Pitner Tire Holders, manufactured by the Pitner Pump Company, Chicago, are designed for cars using platform springs. They carry one or two spare shoes and being constructed of malleable iron will withstand severe service. They come complete with straps and all fittings, are nicely finished in black and are inexpensive.

—— ★ ——

The Liggett Tank Strainer is manufactured by the Liggett Spring & Axle Company, Cleveland, O., and is designed for three purposes, a filling hole for the fuel tank, a funnel and a strainer. A flange is fitted to the tank and the cap is provided with a chain attached to the flange member. The strainer member consists of a chamois and may be removed easily for displacing water or foreign elements when desired. The maker holds that the chamois has as much surface as an eight-inch funnel and that the diameter of the hole, 3.25 inches, permits of cleaning the fuel tank. The strainer is of polished brass, very light and easily attached.

—— ★ ——

The Motometer, marketed by the Motometer Company, Inc., 1784 Broadway, New York City, is a compact device for mounting on the radiator cap and its function is to register the temperature of the water, thereby preventing damage to the motor through overheating or by freezing. Between two crystals retained in a casing, is a silvered dial, indicating the temperature readings. A special red fluid is actuated by the heated air between the water level and roof of the cap and its height is plainly discernible on the dial, being read easily from the seat even in the night time. The Motometer will register from zero to the boiling point of water, is very compact and attractive, and is easily installed. It is gold or nickel plated as desired.

—— ★ ——

The Miller Self-Vulcanizing Tube, marketed by Chas. E. Miller, Anderson Rubber Works, Anderson, Ind., is designed to automatically seal any openings or punctures. It comprises a layer of plastic rubber between two walls of cured rubber and when the tube is punctured the opening is filled by the plastic material which forms into a solid mass. It is constructed for both motorcycles and automobiles and the maker points out that it contains about four times as much rubber as the ordinary tube. It is also held that the plastic material will not dry out or lose its efficiency under severe service.

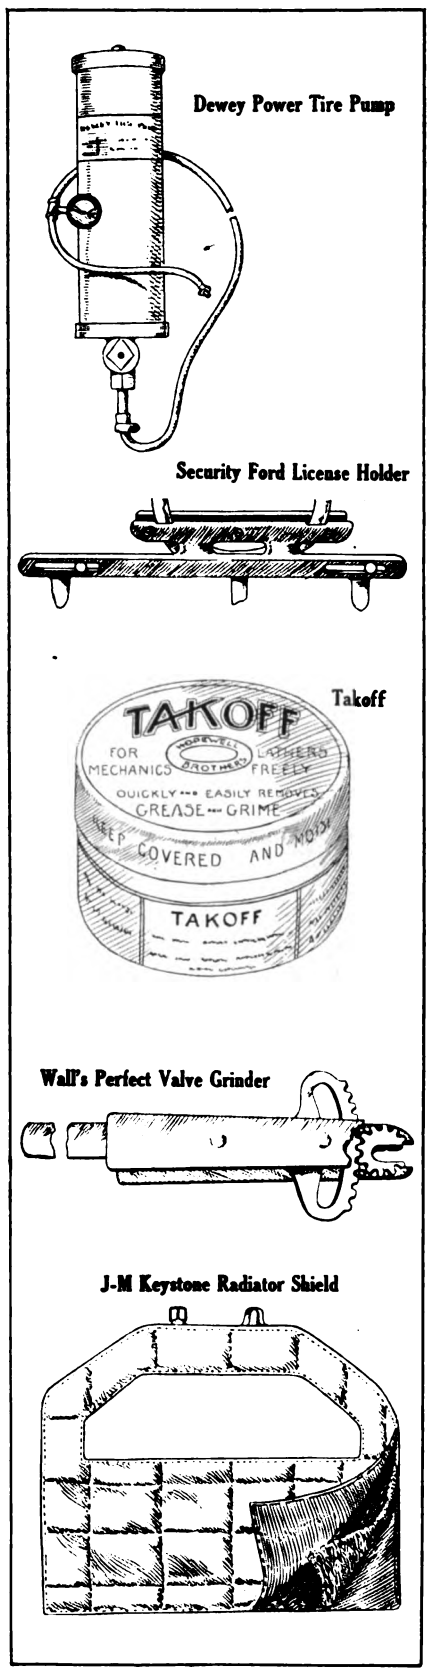
—— ★ ——

The Phinney-Walker Keyless Clocks, marketed by the Coward Auto Supply Company, Boston, are made in several styles and finish to match the trimmings of the car. A feature of the clocks is that they may be wound by rotating the rim. The construction is designed to prevent theft. They are neat in appearance, reliable time keepers and adapted for hard usage.

—— ★ ——

The Dewey Power Tire Pump is manufactured by the Dewey Anderson Company, 420 Knapp street, Toledo, O. It is very light and compact, is but 12 inches in length, and be-

Digitized by Google



ing of brass cannot rust or corrode. All working parts are accurately machined and the pump may be installed permanently on the motor by the utilization of a special connection made by the company. This is accomplished by using a priming cock opening. The Dewey may also be used by removing a spark plug and screwing the pump into the opening by hand. Another method is to tap one of the valve plugs, connecting a tubing with the pump which may be located as convenient. Pure air is taken into the pump and forced to the tire through an ample length of hose having a woven cloth covering, the proper pressure being indicated by a dial pressure gauge. The Dewey does not require lubrication and is very efficient at low motor speeds. It is moderately priced.

—— ★ ——

The Security Ford License Holder, made by the Security Company, 14 Shingiss street, Pittsburg, Penn., is designed for model T Ford cars and a feature emphasized by the maker is that it permits of attaching the license plate to the right hand light bracket instead of the radiator. The holder comprises a split clamp member for securing it to the lamp iron while the lower part of the device is adjustable, permitting of the use of several sized plates.

—— ★ ——

Takoff is produced by Hopewell Bros., Newton, Mass., and is a pumice hand soap paste, made especially for mechanics and those desiring a mixture which will remove all grease and grime from the hands without injury to the skin. It lathers easily and only a small quantity is necessary. It contains no acids or injurious chemicals, and is held to be aseptic. It comes in a neat can and is inexpensive.

—— ★ ——

Wall's Perfect Valve Grinder, made by J. H. Wall, 290 Hope street, Bristol, R. I., will appeal to owners of model T Ford cars, in that the valves may be ground without removing them or displacing the cylinder head. The grinder is so designed that the rotating member engages with the pin securing the valve spring collar, the tool being fitted by lifting the valve spring slightly. A little kerosene is applied to the valve which cuts the carbon, and by working the handle of the grinder back and forth, a rotating movement is imparted. This loosens all carbon and cleans the seat perfectly, insuring proper compression and maximum power. If the valves have been neglected for any great length of time, and are in bad condition, an abrasive may be employed and the tool utilized without removing the valves or head. The grinder is constructed of high grade material, will endure indefinitely and simplifies the work of keeping the valves and seats in proper condition. Each tool is guaranteed.

—— ★ ——

The J-M Keystone Radiator Shield is marketed by the H. W. Johns-Manville Company, New York City, and is constructed for attachment over the front surface of the cooler, keeping the water and motor warm when the machine is left exposed to the cold. It consists of a thick layer of cleansed cattle hair neatly quilted between two layers of water proof imitation leather, and nicely stitched. A flap is provided for exposing the upper part of the radiator when the car is being operated and for closing when the machine is standing.

Digitized by Google

CHANGES REVEALED IN TRUCK DESIGN.

Features of Some Models Which Will Make Their Initial Appearance in Connection with the Annual Show Season---New Concerns Announce Their Products.

PRESENT indications suggest that there will be a large number of new models revealed in connection with the forthcoming commercial vehicle shows in New York and Chicago. This does not mean, necessarily, that in every instance the new cars will offer radical changes, although this will be true with a few concerns. The situation with reference to the mechanical transport is such that as the demand for the product increases wagons and trucks of larger carrying capacity must be produced to meet the needs of the business world. In addition the need for light delivery wagons is meeting with a ready response from the manufacturers. In the main, the general construction of business vehicles is quite as near standardization as with the so-called pleasure car, and when new models are announced it

Knickerbocker Five-Ton Truck, Model 12-5.

does not follow that there has been wide departure from previous practise with the company in question.

It is impossible at this time to forecast with any degree of certainty just how many concerns will add the worm drive, for instance. A large number of makers have seen fit to make advance announcement of their new designs, and with such it is possible to tell what will be shown, but there are several, who are known to have been working on improvements or alterations, which are not yet ready to take the public into their confidence. In other words, there is no disposition to offer untried experiments, and such productions as will be submitted for inspection will be those which have been tested under conditions similar to those to be encountered in actual service.

KNICKERBOCKER FIVE-TON TRUCK.

Addition to the Line Which Comprised a 3.5 and a Four During the Past Year.

A five-ton Knickerbocker truck has been added to the 3.5 and four-ton models made by the Knickerbocker Motor Truck Company, New York City, during the past year. The general design is the same, continuing the provisions for accessibility of motor, clutch, transmission and jackshaft assemblies. By this is meant that the radiator is hinged, so that by loosening the connections the entire power plant, on its hickory sub-frame, may be withdrawn from the chassis.

The motor has bore of 4.75 inches and stroke of five, and the cylinders are cast separately. Lubrication is by combined force feed and splash. The transmission is so designed as to have the gears constantly in mesh, and sliding dog clutches are expected to take the strain equally. On direct drive, all gears are idle.

BESSEMER ADDS TWO MODELS.

One Is Larger and the Other Smaller Than the Original Machine of This Make.

Two new Bessemer models, one of 1000 pounds capacity and the other of 1.5 tons, have been added to the line made by the Bessemer Motor Truck Company, Grove City, Penn., the original truck of this make being a one-ton machine. These are practically the same in design, and two sizes of motor are utilized. That for the smallest chassis, known as model A, has a horsepower rating of 18, with bore of 3.5 inches and stroke of 4.5, while those for models B and C are the same, rated at 22 horsepower and with 3.75-inch bore and 4.5-inch stroke. Cooling is by water, lubrication by a gear driven pump, ignition by Briggs magneto and the carburetor a Rayfield.

The clutch is a leather faced cone. The transmission is selective, giving three speeds forward and reverse. Drive is by shaft, jackshaft and side chains. Brakes are internal expanding and

Digitized by Google

operate within drums on the rear wheels. The axles are steel drop forgings, the front member on the A being square and on B and C, I section, while the rear axles are rectangular in form. The

Bessemer One-Ton Wagon, Model B.

frame is a pressed steel channel section and is suspended on semi-elliptic springs. The wheelbase is 102, 120 and 136 inches, respectively.

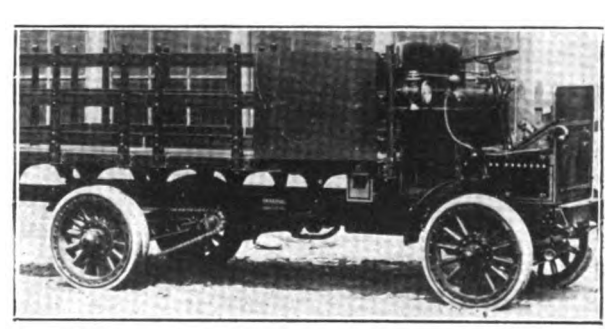
KING TRUCK IS NEW.

Made in Kingston, N. Y., with Carrying Capacity Rated at 3.5 Tons.

An entirely new 3.5-ton truck is the King, made by the A. R. King Manufacturing Company, Kingston, N. Y. The motor is a four-cylinder, four-cycle, water-cooled unit of 32.4 horsepower, located under the driver's seat. The cylinders are of the L head type and are cast in pairs, with bore of 4.5 inches and stroke of 5.5. Lubrication is by a self-contained force feed system. Ignition is by Bosch dual system with fixed spark.

The clutch is a multiple disc, faced with Raybestos, this and the engine being mounted as a unit in a sub-frame that is supported at three points, and this assembly may be removed from the chassis through the front without removing the seats or floorboards. The transmisson is selective, affording three speeds forward and reverse, and the wide faced gears are always in mesh, the engagement being by sliding jaw clutches. The differential is assembled as a unit with the gearset, also suspended at three points, the final drive is by double side chains.

The frame is a rolled steel channel, and the springs are semi-elliptic. The front axle is an I section drop forging of steel and the rear is rectangular. ServiS brakes are external contracting on the jackshaft and the emergency members, internal expanding on the rear wheels. Tires are 36 by six inches in front and 36 by eight inches dual in rear. The wheelbase is 120 inches and the body platform is 156 inches long and 72 inches wide.



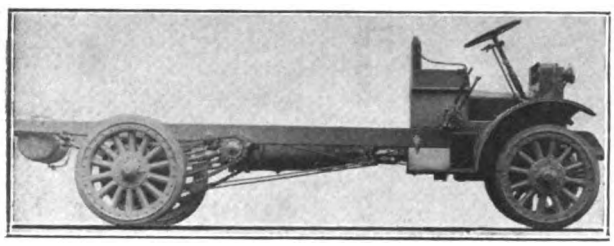
WORM DRIVEN UNIVERSAL.

New One-Ton Model Thus Equipped—Two-Ton Continues Features of the Three.

While the initial use of the worm drive for commercial vehicles in America was in trucks of five tons capacity, it will be noted this year, that a number of light wagons are being equipped in this manner. One of the concerns to adopt this plant is the Universal Motor Truck Company, Detroit, which is now producing three models. The three-ton is continued from last year with only minor changes, and a new two-ton utilizes the same motor and other features of construction. The real innovation in the line is the one-ton vehicle, which has the worm drive.

The lightest model has a motor of the L head type, its four cylinders being cast en bloc and having bore of 3.75 inches and stroke of five. The horsepower rating is 30. Cooling is by water, and a departure from previous Universal practise is found in the location of the vertical tube radiator at the front of the chassis frame, instead of back of the motor and under the seat as in the other two models.

Lubrication is by the constant level splash system, supplied by a gear driven pump. Ignition is by dual high-tension system. The clutch is a single disc dry plate. The transmission is suspended at three points and gives three forward speeds and reverse. The worm is located within the full floating rear axle. The front axle is a



Universal Two-Ton Wagon.

heavy I section drop forging of steel.

The chassis frame is a steel channel section six inches wide and .1875 inch thick, with cross members. Springs are semi-elliptic. Brakes are

Digitized by Google

of the internal expanding type acting in drums 16 inches in diameter and with faces two inches wide, and are fully enclosed. Tires are 34 by 3.5 inches in front and 34 by five in the rear. The

B. A. Gramm's 3.5-Ton Truck Chassis.

wheelbase is 124 inches and the loading space, either 108 by 60 or 144 by 60 inches. The driver is located at the left.

B. A. GRAMM'S TRUCKS.

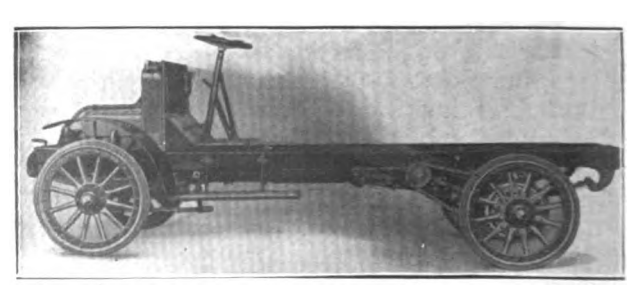
Two Models Are Being Produced by Gramm-Bernstein Company in Lima, O.

The sale of the Gramm Motor Car Company of Lima, O., to John N. Willys of the Willys-Overland Company, Toledo, and the subsequent organization of the Gramm-Bernstein Company of Lima, with which B. A. Gramm is now identified, has resulted in the production of two new models, of two and 3.5 tons, which are known as B. A. Gramm's trucks. Features which are common to both are the utilization of the Gray & Davis electric lighting and starting system, the storage battery of which furnishes current for ignition through an Atwater Kent unisparker, and the mounting of the Continental motor on a subframe carried on four coiled springs. The larger vehicle has transmission affording four forward speeds and reverse. In the main the specifications are the same for each.

The motor has bore of 4.5 inches and stroke of 5.5, and the cylinders are cast in pairs. The clutch is a multiple disc, faced with Raybestos. The transmission is held to be of new design. It is of the selective type with the gears always in mesh, but the construction is such that on direct drive all gears are stationary. The differential and gearset are in one assembly within a semi-steel case. The jackshaft is of the full floating type with annular ball bearings throughout.

Timken axles, fitted with Timken bearings, are used. The frame is of press steel channel section, of unusual width and depth, and is carried on semi-elliptic springs, with improved steel shackles. Service brakes are external contracting on the jackshaft and the emergency, internal expanding on the rear wheels. The wheelbase on the smaller chassis is 128 inches and on the larger, 140.

The driver is placed at the right, with the motor between the seats. The dash is directly behind the radiator at the forward end of the frame. It is maintained that the bed of the vehicle is from six to 12 inches lower than the average, making for easier loading and undoading.



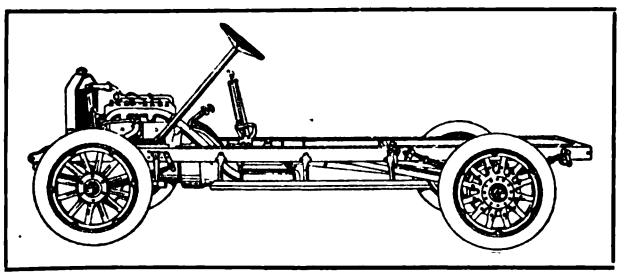
NEW TWO-TON ADAMS.

Addition to Line Continues Features Proven Successful in Previous Designs.

Continuing the method of radiator and motor suspension which made its appearance last year on the one and 1.5-ton Adams vehicles, the Adams Bros. Company, Findlay, O., is presenting a new two-ton model. The particular feature of the radiator, which is fitted with two filler caps, is its location at the rear of the motor, where it is carried on flexible supports. The motor is mounted on a sub-frame, under a Renault type of hood, which is so hinged as to permit full accessibility to the power plant for removal, or work upon its components while in the chassis.

The new motor does not differ materially from the others, being a four-cylinder, water-cooled unit, cast en bloc, with bore of 3.875 inches and stroke of five. On a bracket at the forward end and driven by a cross shaft are the high-tension magneto and spiral gear driven centrifugal water pump. Lubrication by by combined force feed and splash.

The clutch is a multiple disc dry type, and the transmission is selective, giving three speeds forward and reverse. The transmission gearset is assembled with the jackshaft and is supported by two arms from a heavy cross member. The jackshaft shafts are not enclosed and each car-



Adams One-Ton Wagon, Model A.

ries a brake drum inside the frame, on which the service member contracts. Final drive is by chains.

The front axle is an I section and the rear,

Digitized by Google

rectangular, both being dropped forged. The frame is a wide pressed steel channel section that is "necked" at the forward end between the front wheels. Springs are semi-elliptic. Tires are 36

Brown Commercial Car, 1500 Pounds Capacity.

by four inches in front and 36 by 3.5 in rear. The driver is located at the left.

BROWN DELIVERY WAGON.

New Concern in Peru, Ind., Enters the Market with 1500-Pound Vehicle.

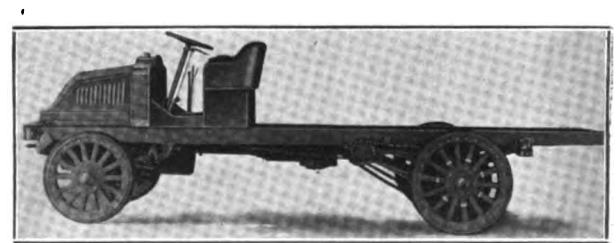
The Brown Commercial Car Company, Peru, Ind., has entered the market with a new wagon of 1500 pounds capacity, termed the Brown commercial car, to which are fitted as standard, stake platform, covered express and fully enclosed bodies. The motor is a four-cylinder, four-cycle, water-cooled unit of the L head type, with cylinders cast en bloc. The bore is 3.75 inches and the stroke 5.25, giving a rating of 22.5 horsepower under the S. A. E. formula. Cooling is by water, a centrifugal pump being employed to circulate the fluid through the vertical tube radiator suspended on coiled springs. Lubrication is by two plunger pumps driven by eccentrics on the camshafts. Ignition is by Remy magneto.

The clutch is a multiple dry plate type, and the transmission is selective, giving three speeds forward and reverse. The motor, clutch and gearset are assembled as a unit. Both the emergency brake and the speed changing levers are mounted with the power plant, and are held to be entirely free from stresses due to chassis distortion when traversing rough roads, etc.

The relation of the rear axle is maintained by two tubes extending from the brass spiders on the axle to a cross member on the chassis, the globe forward ends being mounted in bronze bushed sockets. Ample provision is made for adjustment. The frame is of pressed steel, and the suspension is by semi-elliptic springs. Tires are 34 by 3.5 Motz in front and 34 by four-inch Motz in the rear, with an option of 34 by 4-5-inch pneumatics on demountable rims.

WATER-COOLED KELLY MODELS.

Prominent Manufacturer of Air-Cooled Vehicles Makes Radical Departure.



In some respects the change from air-cooled to water-cooled motors in the Kelly line is one of the most radical departures from former practise to be announced previous to the holding of the shows. As is more or less well known the Kelly Motor Truck Company, Springfield, O., has changed its name to the Kelly-Springfield Motor Truck Company, and coincident with this announcement comes the information that new tools and materials have been acquired so that the new line will be entirely new in every respect.

The construction of the chassis frame also has undergone radical change, in that instead of endeavoring to secure rigidity, there is attempt to make a frame as elastic as possible, so that it will yield to the tendencies toward distortion and yet will maintain the original form when relieved of such strains. Other alterations in design will be apparent from a study of the specifications herewith.

Two models will be presented, one being designed for carrying loads of one ton capacity and the other for three-ton loads. These differ largely in the motor and the matter of jackshaft assembly. Other details will apply to each.

The larger motor is a four-cylinder, four-cycle, water-cooled, T head type, with cylinders cast in pairs. The bore is 4.5 inches and the stroke 6.5, the horsepower rating being 38.75. The smaller engine is of the L head type, with its four cylinders cast en bloc. The bore is 3.75 inches and the stroke 5.25, the rating being 30 horsepower.

Cooling is by centrifugal pump, driven by a cross shaft at the forward end of the motor. The radiator is located back of the engine and is incorporated with the dash. Lubrication is by the

Kelly Three-Ton Truck Chassis, Model K-40.

dry base, self-contained, force feed system. Ignition is by Eisemann high-tension magneto, fitted with a governor which automatically advances and retards the spark.

Digitized by Google

The clutch is a leather faced cone. On the larger model the clutch shaft is coupled to the drive shaft by a double universal joint, and the main drive shaft is enclosed in a torque tube that is supported at its forward end in the centre cross member of the frame by a double swivel joint. The transmission gearset, incorporated with the jackshaft, is of the selective sliding gear type, giving three forward speeds and reverse. The ends of the jackshaft housing are mounted in globe sockets at the sides of the chassis frame, and the construction is of the full floating type. In the smaller model the construction of the transmission is the same save that the jackshaft is of the semi-floating type.

Final drive is by side chains. Brakes are internal expanding on the rear wheels. Springs are semi-elliptic. Tires are 38 by five inches, single equipment in front and 42 by five-inch dual in rear on the larger model, and 36 by 3.5 inches forward and 36 by four inches rear on the smaller. In the latter instance an option of 38 by 3.5 pneumatics with an extra demountable rim is given. The standard wheelbase of the larger is 150 inches, but options of 130 and 172 inches are offered, while the standard wheelbase of the smaller model is 120 inches.

Wichita Two-Ton Wagon, Model B.

TWO WICHITAS FROM TEXAS.

With Capacity of One and Two Tons, Respectively, They Follow Standard Lines.

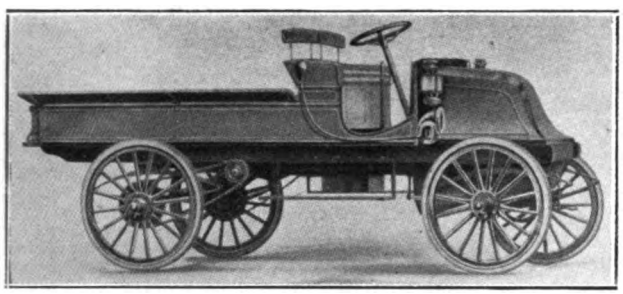
About a year ago the Wichita Falls Motor Company was organized in Wichita Falls, Tex., for the production of Wichita trucks. The new vehicles made their appearance at the Kansas City and Denver shows, and have enjoyed splendid success. They are produced in two models, of one and two tons capacity, and are equipped with a wide variety of body designs. The two chassis do not differ materially, except in the size of the motor and other components. Model A, the smaller, has a motor with bore of 3.25 inches and stroke of five, while the bore of the B motor is 3.5 inches. The wheelbase of the former is 110 inches and of the latter, 118.

The four-cylinder motor is of the water-cooled type, with the cylinders cast en bloc, and it has a crankcase of the barrel design with an aluminum oil reservoir bolted to the bottom. Lubrication is by a combined force feed and splash system. Ignition is either by Bosch or Eisemann high-tension magneto. Cooling is by the thermo-syphon system, with the radiator carried at the forward end of the chassis.

The clutch is a leather faced cone, and the transmission is of the selective sliding gear type, the shafts being mounted in high duty roller bearings. Drive is through a jackshaft and side chains to the rear wheels. The forward axle is an I section drop forging and the rear member, a rectangular steel forging. The frame is a pressed steel channel section and is carried on semi-elliptic springs of liberal proportions. The wheels are of the artillery type, 34 inches in diameter. Brakes are internal expanding, the service member on the jackshaft and the emergency, in rear wheel drums. The driver is located at the right.

THREE BROCKWAY MODELS.

Two-Cycle, Three-Port, Air-Cooled Motors Utilized by This Concern.



The Brockway Motor Truck Company, Cortland, N. Y., announces three new Brockway models, which are said to be the result of five years of experimentation. These are rated as follows: Model A, 1000-1500 pounds; B, 2000-2500; C, 3000-3500. The motor in each is of the two-cycle, three-port, air-cooled type, and it is maintained that it is of extremely simple construction with but seven moving parts.

The engine in model A has bore of four inches and stroke of five, and is rated at 20 horsepower. This is placed under a Renault type hood, through openings in which the draft of air is drawn about a shield that protects the lower section of the engine case. Ignition is by Bosch magneto with fixed spark.

The drive is through a cone clutch and a planetary reduction gearset, giving two forward speeds and reverse, the entire assembly running in a bath of lubricant, a jackshaft and double side chains to the rear wheels. The frame is of wood reinforced with steel angles, and the springs

Digitized by Google

are full elliptic front and rear. The axles are steel forgings. Brakes are internal expanding on the rear wheels. Wheels are 36 inches in diameter in front and 38 inches in diameter in the

Model A Brockway, 1000 Pounds Capacity.

rear. The wheelbase is 100 inches.

The motor of model B is the same, but the transmission is selective, giving three forward speeds and reverse. The axle sizes are increased and the wheelbase is extended to 106 inches. The service brake is internal expanding on the jackshaft and the emergency, of the same type, on the rear wheels. Model C has a motor with bore of 4.5 inches and stroke of five, rated at 30 horsepower, and a wheelbase of 112. In all other respects it resembles model B.

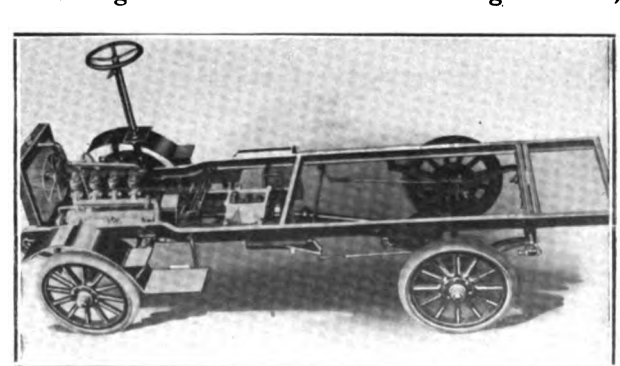
NEW POPE-HARTFORD FEATURES.

Five-Ton Machine Added to Line and Three-Ton Vehicle Presents Changes.

For the 1913 season the Pope Manufacturing Company, Hartford, Conn., is producing two models of the Pope-Hartford truck, one being a new five-ton machine and the other the three-ton vehicle of 1912 with changes in design. These latter cannot be termed radical, however, and consist mainly of a longer wheelbase, a four-speed transmission, a locomotive type of brake on drums on the jackshaft, and other details of less prominence.

The motor is the same in both models, has bore of 4.75 inches and stroke of 5.25, and is rated at 50 horsepower. It is of the four-cylinder, four-cycle, water-cooled, vertical type with cylinders cast in pairs. The radiator, of the company's own planetic type, is suspended so as to be free from all torsional stresses. Lubrication is by splash. Ignition is by a dual system, employing an Eisemann high-tension magneto with automatic advance.

The clutch is a cone member, and the transmission is of the selective sliding gear type, providing four forward speeds and reverse, with direct drive on the fourth. The differential is of the spur gear construction, with chrome nickel steel gears and large shafts, enclosed in the jackshaft housing. Final drive is by double side chains. Springs are semi-elliptic with two heavy duty helical auxiliary springs over the rear axle, which is of rectangular section of large proportions. The front axle is an I section. Service brakes contract on drums on the jackshaft, while the emergency members expand within drums on the rear wheels.



This description will apply to both models in the main, although the construction is not as heavy with the three-ton machine. Both are fitted with demountable rim equipment, the smaller having wheels of 36 inches diameter, while the larger has 36-inch wheels in front and 42-inch in the rear. The wheelbase of the three-ton vehicle is 138.5 inches, with an option of 160 inches, and the five-ton machine has wheelbase of 140 or 160 inches.

THE PRACTICAL PIGGINS.

Wisconsin Increases List of New Trucks in the Market by Three Models.

The Piggins Motor Truck Company, Racine, Wis., presents three new Practical Piggins vehicles, rated at one, two and three tons. The motors are all of the Waukesha make, and that for the smallest chassis has bore of 4.25 inches and stroke of 4.75, while the others have bore of 4.75 and stroke of five. Accessibility is a feature of the design, the motor being taken from the chassis readily after the radiator has been removed.

The clutch is of the cone type, and the transmission gearset is selective with sliding clutches,

Practical Piggins Three-Ton Truck Chassis.

in which the gears are constantly in mesh. Directly back of the transmission case is the service brake. Coupled to this shaft by a universal joint is the driving shaft, which is enclosed in a tubu-

Digitized by Google

lar housing, and this housing is incorporated with a case that encloses a differential gear and the supplementary or countershaft. This shaft assembly is fitted with a large arm at either end which turns on a wide babbit bearing, and the other ends of the arms are secured to the squared rear axle. The ends of the countershaft carry spur pinions which mesh with spur gears mounted on sleeves to which the wheels are secured.

HATFIELD DELIVERY MODELS.

Two Three-Cylinder, Two-Cycle, Air-Cooled Models Present Novel Features.

The Hatfield Auto Truck Company, Elmira, N. Y., is producing two models of the Hatfield delivery wagon, these being rated at 1000 and 2000 pounds. The main differences are in the spring and tire sizes, and in the wheelbase, the

Hatfield One-Ton Wagon, Model K.

former having 88 inches and the latter 96. A particular feature lies in the construction of the front axle, which is the same as that utilized in animal wagons and swings on a king bolt on a turntable.

The motor is a three-cylinder, two-cycle, air-cooled unit, with bore of 4.125 inches and stroke of four, rated at 18-20 horsepower. It is maintained that of the 99 parts in the motor, but nine are moving. The cylinders are cast with wide and thin longitudinal fins and the heads are spherical. The rim of the flywheel carries a series of blades which serve as a fan. The cylinders are covered with a light metal shield or jacket which has an opening close to the screen in the hood, and there is a deck about the bottom of the radiating fins. The suction of the flywheel draws a current of air over the motor and down between the fins, radiating the heat.

A driven wheel on the cross shaft contacts with a plate attached to the rear face of the flywheel. Thence power is transmitted to a sprocket on the cross shaft to the jackshaft, and final drive is by side chains. There is no bevel and pinion device in the jackshaft, but an expanding cam is enclosed in the brake drums on the ends of this shaft, and these are claimed to operate satisfactorily in making turns.

The frame is of angle steel and the springs are held to be ample. The service brake is on the jackshaft and the emergency member, on the rear wheels. Tires are 34 by three inches in front and 34 by 3.5 in rear.

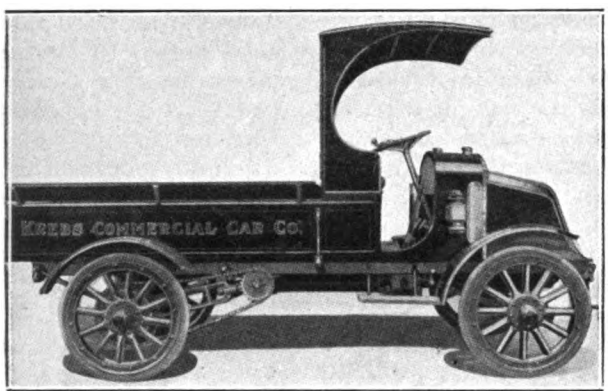
STANDARD THREE-TON TRUCK.

New Model from Detroit Incorporates Convention Design and Standard Components.

The Standard Motor Truck Company, Detroit, is producing the Standard three-ton truck, in which it is maintained that standard components and design have been incorporated. By this is meant that it reflects all the standards of the Society of Automobile Engineers, and the components are also the product of standard makers.

The motor is a four-cylinder, water-cooled Continental of the L head type, with bore of 4.5 inches and stroke of 5.5, rated at 40 horsepower. The cylinders are cast in pairs. Provision is made for removal of the entire power plant, comprising engine, clutch and gearset, by detaching the radiator and forward cross frame member, which serves as a bumper. Lubrication is by positive plunger pump. Ignition is by Eisemann magneto with automatic advance.

The clutch is a multiple disc of the dry plate type, faced with Raybestos. The transmission is selective, giving three speeds forward and reverse. The frame is of channel section. Service brakes are external contracting on the jackshaft, which is a unit construction and easily removable, and the emergency members are internal expanding on the rear wheels. Springs are semi-elliptic. Tires are 36 by five inches in front and the same dimensions dual in the rear.



KREBS DELIVERY WAGONS.

Two Models, One of 1500 Pounds and the Other of One Ton, Produced in Clyde, O.

The Krebs Commercial Car Company, Clyde, O., is producing two Krebs delivery wagons, one listed as model A, a one-ton vehicle, driven by

Digitized by Google

chain and fitted with solid tires, and the other as model B, of 1500 pounds capacity, driven by shaft and utilizing pneumatic tires. In all other respects the specifications are similar.

Krebs 1500-Pound Wagon, Model A.

The motor is a two-cylinder, two-cycle, water-cooled unit, with bore of 4.5 inches and stroke of five. Ignition is by Bosch high-tension magneto. The radiator is incorporated with the dash and a Renault type of hood is employed. The clutch is a cone. The transmission is selective, giving three forward speeds and reverse. Springs are semi-elliptic. Solid tires are 34 by three inches and pneumatics, 34 by four inches. The wheelbase is 100 inches. The driver is placed at the left with centre control levers.

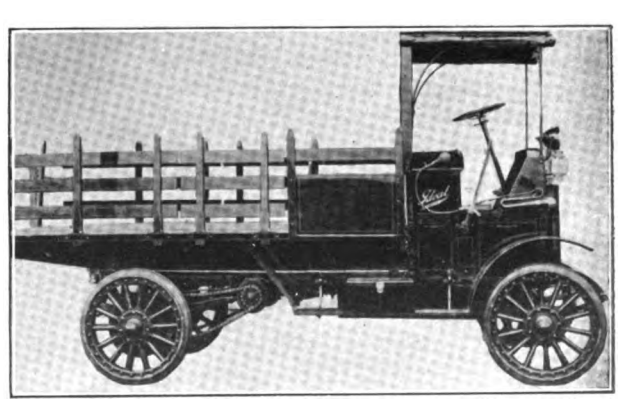
NEW MODEL FROM MARYLAND.

Crawford Automobile Company of Hagerstown Producing Light Delivery Wagon.

An addition to the list of light delivery wagons is the Crawford model 13-30, made by the Crawford Automobile Company, Hagerstown, Md. This has capacity of 1200 pounds and is designed for light, quick work.

An option is given in the matter of the motor, either a Continental or one of the firm's own make. The bore and stroke is the same with each, 4.25 by 4.5 inches, and the rating is 30 horsepower. Cooling is by water, and lubrication is by a continuous supply of oil from a gear driven pump. Ignition is by a dual high-tenson system.

The clutch is a leather faced cone, and the universal joint between it and the gearset is enclosed in a water and dust tight case. The transmission gives three forward speeds and reverse. Brakes are internal expanding and external contracting. Springs are semi-elliptic in front and half-scroll elliptic in the rear. Tires are pneumatics, 32 by 3.5 inches in front and 32 by four in rear. The driver is located at the right.



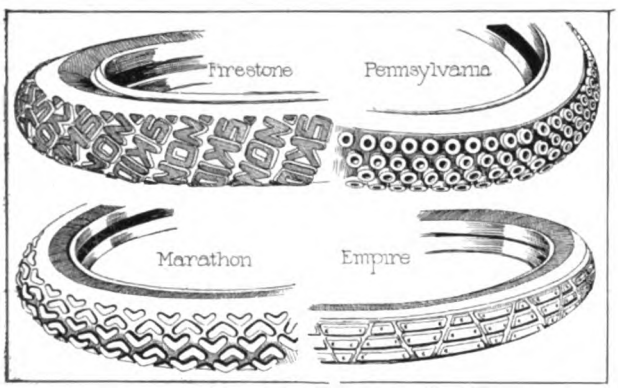
CHANGES IN IDEAL TRUCKS.

Model H Has Been Redesigned and the Largest Chassis Has Increased Capacity.

The Ideal Auto Company, Fort Wayne, Ind., is continuing its three models, G, H and I, but the two first named have undergone slight changes. Model H has been redesigned, although this should not be taken as indicating that the alterations are in any respect radical. Model G, which formerly was rated at 3000 pounds capacity, is not listed as a two-ton, this necessitating the use of heavier axles, springs, etc. Model I is a 1500-pound wagon.

The redesigned chassis is rated at one ton. The changes include a new motor, having a bore of 3.75 inches and stroke of 5.25, as against 3.5 and 4.5, respectively. This means greater power. The frame formerly was of wood and steel, but this has been replaced by a pressed steel construction. The wheelbase has been increased from 115 inches to 120.

Thirty-seven hundred miles of publicity and a chain of working organizations, all promoting the big San Francisco fair in 1915, is the undertaking just begun by C. W. Armstrong, one of the officers of the San Francisco Chamber of Commerce. He is now on a tour from Boston to San Francisco in a Rambler Cross Country car, made by the Thomas B. Jeffery Company, Ke-



Ideal Two-Ton Wagon, Model G.

nosha, Wis., and will visit all the principal cities, delivering addresses to the chambers of commerce and prominent business men's associations of the United States.

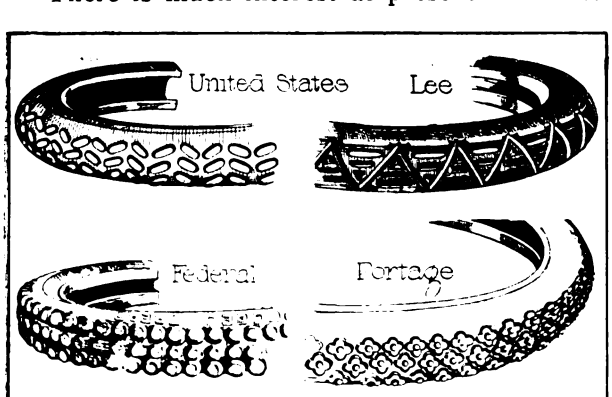
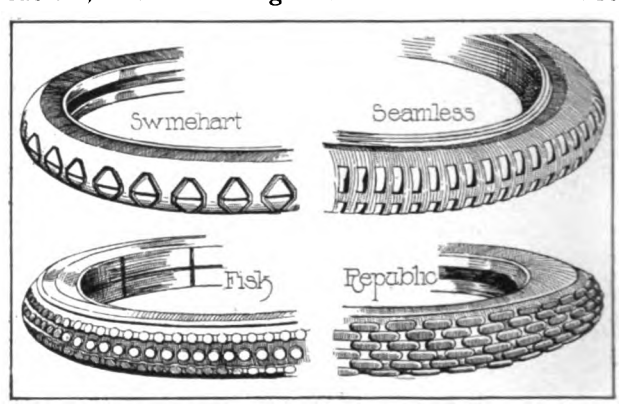
FACTORS IN TIRE AND RIM EQUIPMENT.



BECAUSE many manufacturers of cars are offering an option in the matter of tire and rim equipment, the subject becomes of distinct



importance to the prospective purchaser. To the casual observer it may be that one tire differs from another but very little, this statement applying particularly to the so-called smooth tread type. However, in this opinion there will be decided exception on the part of the tire maker, and not without some reason.

Automobile tires are composed of rubber and fabric. The proportions of these and the arrangements of the various plies and their relation to each other determine in a large measure the differences in construction, while in addition there are the methods of treating the rubber and fabric and of applying these in the process of manufacturing the tire itself. By this is meant the various forms of wrapped and molded treads, and the methods which are termed hand or machine made, etc. These are matters concerning which engineers and designers will disagree, and the car owner must be guided largely by experience or his confidence in the claims offered by the producer.

There is much interest at present in the so-called anti-skid tread. Tire salesmen maintain that the demand has increased materially during the past year. In some instances it is stated that fully 60 per cent. of the sales are of this type, while the lowest estimate in a canvass of a large number of distributing branches and agencies was 33.3 per cent. The demand naturally is greater during the fall and winter months than in the summer, but it would appear that many owners are using anti-skid tires throughout the entire year.

There is a wide difference of opinion, even among manufacturers, as to the superior advantages of the anti-skid tread. While nearly all makers produce tires of this type, some of these contend that the best tire for ordinary use is the plain round tread, maintaining that it rides the easiest, wears the longest and consumes the least

power to drive the vehicle. Others advance exactly the same claims for the anti-skid.

Accompanying illustrations present a number of different types of treads designed to prevent skidding. It will be noted that there is a tendency to utilize projections or indentations, or combinations of the two, in an effort to secure added traction, eliminate friction or prevent the possibility of side skid and drive slip. With many it is maintained that the anti-skid tread forms an additional layer, upon which the wear is taken, so that even after this extra portion has been worn entirely away there is still left as much tire as with the ordinary smooth tread shoe. With some the protuberances are arranged so as to extend beyond the tread and cover a portion of the side. When the tread has been worn so as no longer to present a non-skidding effect, there remain the projections at the side, which are held to possess a distinct advantage in themselves.

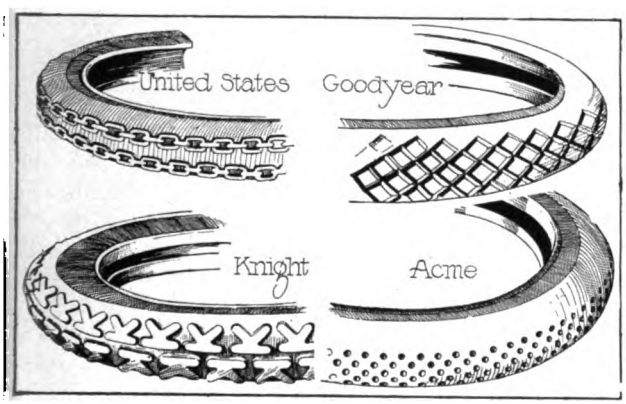
The arguments presented by various tire makers for the particular design of anti-skid tread se-

Digitized by Google

lected will prove of interest. Some of them are as follows:

Acme Rubber Manufacturing Company, Trenton, N. J. —Cup shaped depressions of Dimple tread automatically clean themselves and provide suction. Edges furnish tracking friction.

Ajax-Grieb Rubber Company, New York City—Raised, bevelled, rectangular corrugations create pressure, forming suction, and increase forward and backward traction.



Century Tire Company, New York City—Edges of hand cut (not molded) square blocks on Guard tread scrape their way to positive traction, answering the man at the wheel in every emergency.

Falls Rubber Company, Cuyahoga Falls, O.—Triangular cups sunk into the Neverslip tread pocket air, creating suction, which gives the tire a tendency to stick to the pavement.

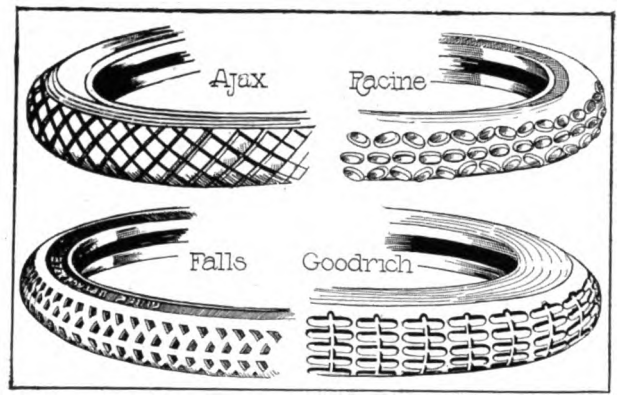
Federal Rubber Manufacturing Company, Milwaukee, Wis.—Large, tough studs of the Rugged tread, arranged parallel, flaring outwardly at the base, offer large traction surface and act as a reinforcement against skidding strains.

Firestone Tire & Rubber Company, Akron, O.—Sharp edges, abrupt angles and hollows of the name grip the road, prevent skid and loss of power, give extra car protection and insure greater mileage.

B. F. Goodrich Company, Akron, O.—Tread bars, in both directions, push out the ooze from under the tire and keep it out, so that the following bars can get a firm grip on a clean spot. The start of a skid is auto-

matically stopped by this street cleaning process. (This Safety Squegee tread was originated by the Diamond Rubber Company, now a subsidiary of the Goodrich concern.)

Goodyear Tire & Rubber Company, Akron, O.—With deep cut blocks the road surface is grasped in every direction by countless edges and angles. The rush of air through these deep cut grooves keeps the tire constantly cool.



Knight Tire & Rubber Company, Canton, O.—Three things determine conclusively the value of the Knight or any other non-skid tire: Quality of the rubber in its composition, thickness of the regular tread underneath the non-skid, actual and relative size of the elevations and depressions which constitute the design. These three characteristics have been developed to the highest degree in Knight non-skid tires.

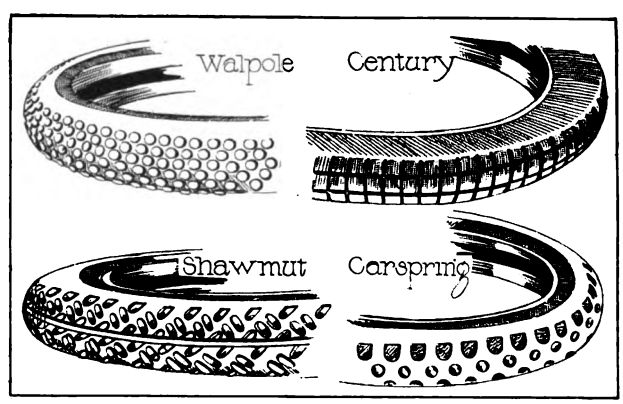
Lee Tire & Rubber Company, Conshohocken, Penn.—Zig-zag tread projections grip the road with all the tenacity of chains. Even after the middle studs wear down the extreme ends prevent the car from skidding.

New Jersey Car Spring & Rubber Company, Jersey City, N. J.—Depressions, semi-circular on the side and in the form of large cups on the apex of the Carspring Clingtite tread, have raised centres which force themselves out, so that the vacuum created is automatically broken.

Portage Rubber Company, Barberton, O.—By its countless edges and angles in every direction, the Daisy tread is a sure grip to the road surface. Rush of air between the openings keeps the tire constantly cool, eliminating all damage from friction heat, even in the hottest weather.

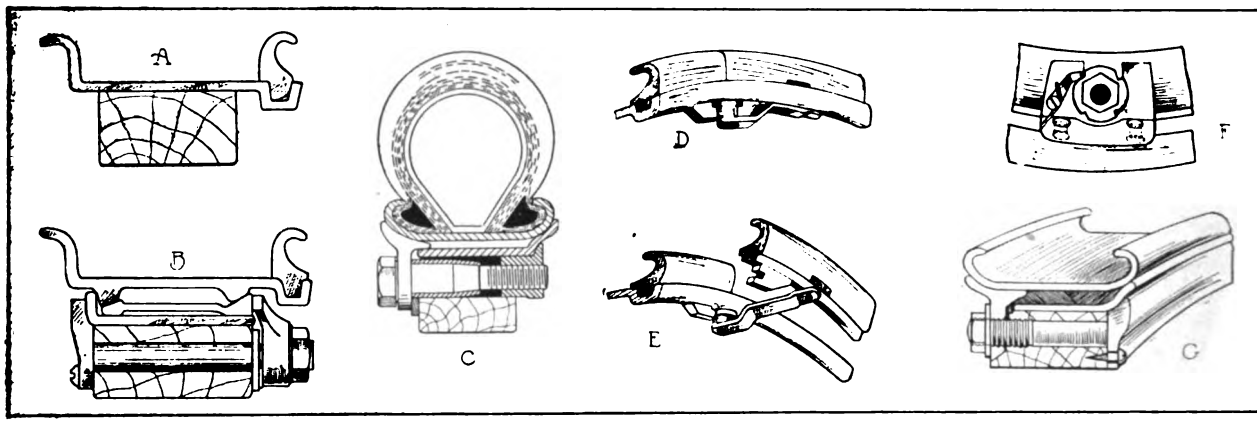
Racine Rubber Company, Racine Wis.—Scientific ar-

rangement of big rubber studs in the Trusty tread provides absolute security against either side or drive slips, under all conditions of service.



Swinehart Tire & Rubber Company, Akron, O.—Sharp edges of depressed groove in the centre of the Keaton tread act on the same principle as a sharp skate on ice, making it impossible to skid sideways, while the many angles of the cross grooves in connection with the centre grooves make it impossible to skid or slide in any direction.

United States Tire Company, New York City—Big, thick, tough, diagonally placed knobs of Nobby tread will grip any kind of road surface, even wet, slimy asphalt pavement, absolutely preventing both side and drive slips. Peculiar formation of Chain tread enables it to resist both side skids and drive slips in much the same way that an ordinary tire chain does.



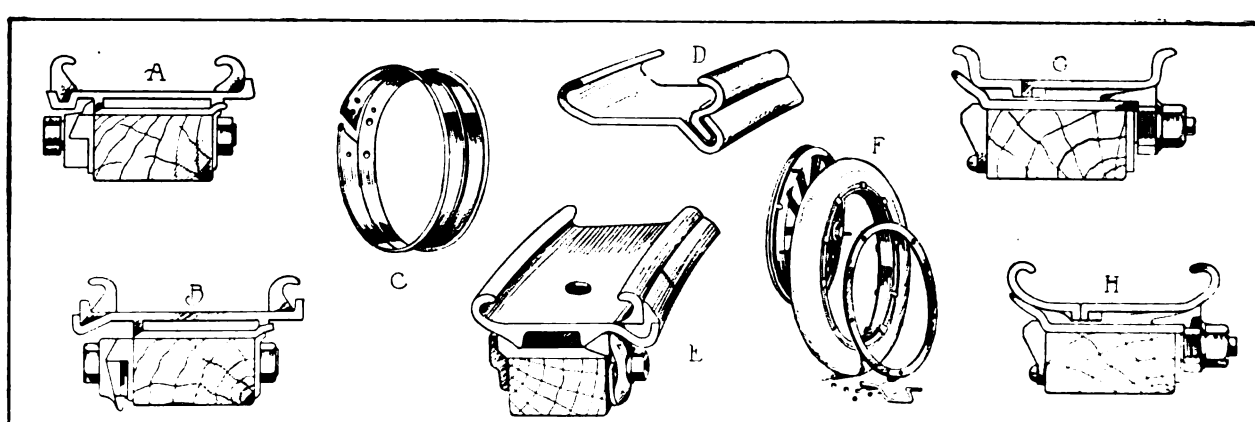
On the other hand, the Seamless Rubber Company, New Haven, Conn., which produces the Security tread, a design believed to have been originated by the Batavia Rubber Company, Batavia, N. Y., and still manufactured by it and a number of other concerns, holds as follows:

The Seamless non-skid tire is the equal in holding and gripping power to the best in the market. In every other respect it is superior, better and best every time; in other words, on a par in strength, durability and resiliency with our Seamless tires. We do not believe in non-skid tires. The chain is the only logical and practical preventive of skidding and side slipping.

It may be conceded that anti-skid tires possess certain advantages without admitting all of the claims made for them. They undoubtedly provide superior traction under ordinary circumstances, and will have a tendency to eliminate the danger of skidding on some conditions of road

Digitized by Google

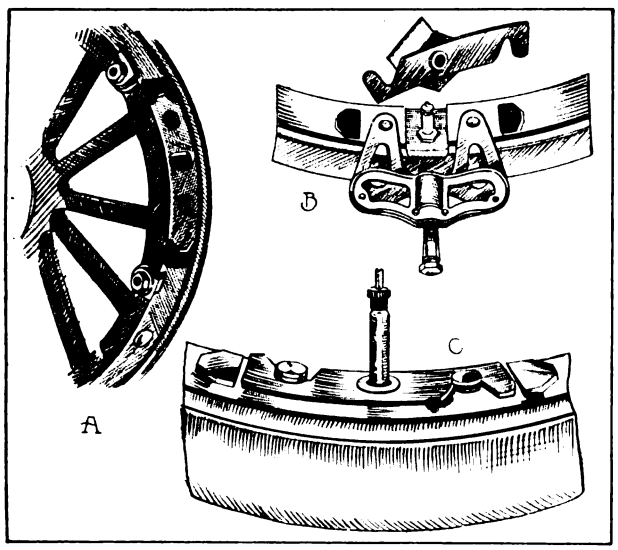
Standard Types of Rims: A and B, Stanweld Detachable and Demountable, the Latter Combining Detachable Feature, Standard Welding Company, Cleveland, O.; C, Baker Demountable for Wood Wheels, Universal Rim Company, Chicago; D and E, Detaching Mechanism on Stanweld, the Former with Latch and Ring Locked and in the Latter Unlocked; F, Dismounting Lug, and G, Cross Sectional View of Lambert Detachable-Demountable, American Rim Company, Detroit.



surface. They usually are applied to the rear wheels only, although some makers recommend that they be utilized in front as well. It is understood that the number of owners adopting this plan is increasing. Some objection has been offered on the score that this would tend to make steering more difficult, but this is said not to be borne out in practise.

The other treads illustrated are: Pennsylvania Rubber Company, Jeannette, Penn., Oilproof Vacuum Cup; Marathon Tire & Rubber Company, Akron, O., Angle; Empire Tire Company, Trenton, N. J., new Non-Skid; Fisk Rubber Company, Chicopee Falls, Mass., Town Car bolted-on, also made in clincher quick detachable clincher and Fisk-Dunlop types; Walpole Tire & Rubber Company, Boston, Mass., Non-Skid; Hood Rubber Company, Watertown, Mass., Shawmut Non-Skid, and Republic Rubber Company, Youngstown, O., Staggard.

There is a tendency on the part of car and accessory manufacturers to standardize certain components and fittings, and this applies to both tires and rims, reference being had more particularly to the latter. It follows that the size and shape of the one is interdependent upon the other.



With the earliest automobiles in America wire wheels of the bicycle type were utilized, and even when these members were of wood the construction was such that the tire was cemented to the felloe without special attention to the design of rim employed. The first variation from this practise was the use of the flange or clincher rim, and while it may be contended that this was a satisfactory product, insofar as it served as a binding member to retain the wheel assembly and afforded a safe means of holding the tire in place, it was lacking in features which make for saving in time and labor.

In an effort to secure an easier method of re-

Additional Standard Rims: A, B, G and H, Types 1, 2 and 3 Standard Universal, Quick Detachable-Demountable, United Rim Company, Akron, O.; C, J-M Demountable, H. W. Detroit Rim, Detroit Demountable Rim Company, Detroit: A, Locking Device on Felloe Band; B, Means for Locking Tire Rim; C, Travelling Plate That Fits Lock on Felloe Band.

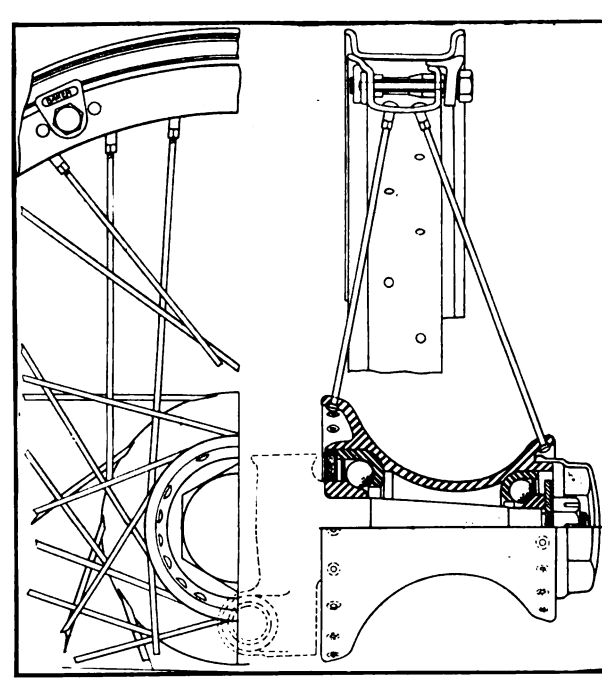
moval and replacement, particularly in the matter of eliminating the necessity for forcing the bead of the tire over the edge of the rim, the next step was the adoption of a removable flange. This later was simplified so as to include the accommodation of the so-called Dunlop or straight side tire. In the last analysis this resulted in the quick detachable rim.

There still remained the matter of inflation, insomuch as the new shoe must be filled with air after being applied to the rim. The fitting of the power tire pump and the use of compressed air has reduced this labor to a minimum, but there is little question that the desire to avoid the manual labor necessary at the time resulted in the demountable rim, carrying a fully inflated clincher or straight side tire.



Several variations of the demountable rim were found to be desirable, because while it is possible to make quick changes on the road, there comes a time when the tire must be removed from the rim and replaced with another, and this work was not simplified by the demountable feature in itself. Perhaps the first attempt to solve this problem was the utilization of a removable rim carrying a clincher or straight side tire and fitted with a removable flange. It was but a step to the addition of the quick detachable feature.

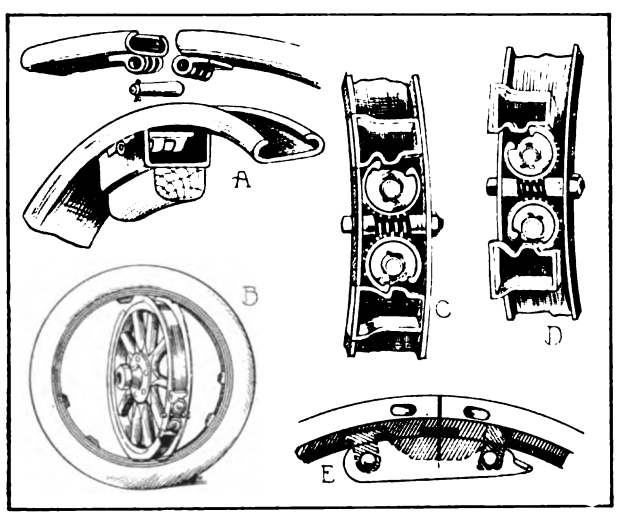
There are numerous types of detachable, demountable and detachable-demountable rims in the market. Some makers have carried the matter still further and make it possible to remove the entire rim and felloe from the spokes, and others have constructed special rims for particular types of tires. The interest in the modern wire wheel has resulted in the production of rims intended for use with these, as well. Among the sketches herewith, presenting some of the features of differing types, will be found two for wire wheels, one of these being of the detachable and the other of the demountable form.

The demand for standardization has resulted in the withdrawal of many tire makers from the business of producing rims, these having turned their patents, engineering data, etc., over to a separate concern. This led to the adoption of certain types of rims, these embodying standard and universal features, which have been incorporated into the products of other concerns engaged in this line, so that it will be found that these are now interchangeable and that practically all makes of tires fit any rim.

The engineering problems involved must take into consideration not only the compressional loads upon the whole wheel assembly, but the stresses due to high speed and the strains upon the rim caused by skidding, etc. The factor of safety also enters into the construction of the locking means, although the prospective purchaser may be more directly concerned with the simplicity of the demountable or detachable features.

No attempt has been made herein to cover the tire and rim situation in its entirety. The object has been rather to suggest some features

Cross Sectional View of Baker Demountable Rim for Wire Wheels and Method of Attachment to Wheel.



Digitized by Google

which should be considered in making selection. As with the tires, several representative makes of rims are presented in accompanying sketches, these serving to illustrate some of the types available, and a little study should indicate their method of operation.

MOTORING IN NATIONAL PARKS.

Secretary Fisher Recommends Large Expenditures for Opening Three in California.

That Yosemite and other national parks in the Pacific region are to be opened to motorists as soon as Congress appropriates funds to make the grades safe for such travel, is the answer of Secretary Fisher of the Department of the Interior to the California automobilists who recently

Booth Rims, Booth Demountable Rim Company, Detroit: A, Quick Detachable Split Clincher, Locked and Unlocked; B, Demountable Feature; C, Means for Forcing Tire Off; D, Tire Drawn on and Locked; E, Quick Detachable Locking Ring Mechanism.

urged the opening of the national parks to motor vehicles.

Secretary Fisher in his annual report recommends the expenditure of $268,403 in national parks in California the coming year as follows: Yosemite, $80,000 to $233,000; Sequoia, $15,500 to $29,900; General Grant, $2000 to $4000.

MATHESON TO REORGANIZE.

President Shepherd Appointed Temporary Receiver and Business Will Be Continued.

The Matheson Automobile Company, Wilkesbarre, Penn., maker of Matheson silent six cars, has been placed in the hands of a receiver. William C. Shepherd, president and general manager of the concern, having been appointed by Judge Charles B. Witmer in Pennsylvania, and ancillary receiver in New York State by United States Judge Holt. It is stated that the details of the readjustment plans will be issued in a short time and that pending this action the business will be continued by the receiver. Liston L. Lewis, counsel for the reorganization committee, and James N. Rosenberg of Rosenberg & Levis, counsel for the Bosch Magneto Company and the creditors' protective committee, have issued the following joint statement:

"It was lately found necessary to refinance the affairs of the Matheson Automobile Company. A plan of financial readjustment was prepared about a month ago which has met with the approval of about 80 per cent. of the stockholders and 60 per cent. of the creditors. Pending the completion of the plans of reorganization it was found advisable to apply for a short term receivership. Meetings of stockholders, creditors and directors of the company were held at Wilkesbarre. At these meetings it was decided to ask for the appointment of William C. Shepherd, the president of the company, as receiver.

"Co-operating with Mr. Shepherd in this matter is a creditors' committee consisting of G. Jahn, treasurer of the Bosch Magneto Company; H. P. Jones, president, Phineas Jones & Co., and E. S. Fretz, president, Light Manufacturing & Foundry Company. The committee states the indebtedness may be estimated at about $600,000 with the outstanding capital stock of about $2,500,000. The assets appear in the papers filed as above $1,000,000."

OPTION OF MEAD MOTOR.

Speedwell Company Arranges Finances to Permit Adopting Innovation in Marketing.

The Speedwell Motor Car Company, Dayton, O., maker of Speedwell pleasure cars and trucks, has arranged a bond issue of $150,000, which has been subscribed. The proposition of increasing the capital stock of the company to $600,000 will be submitted to the stockholders immediately. This bond issue was planned to take care of the extension of Speedwell production, involving the use of Mead rotary valve six-cylinder motors on a portion of the output of new pleasure cars. After tests extending over two years the Speedwell company has taken a license under the Mead patents for this motor.

While for some time foreign makers have offered the motor car buyers choice of poppet or non-poppet valve motors, the Speedwell company claims to be the pioneer in this country in thus equipping its cars at the customer's option. The Speedwell car has a standard chassis and the cars will be alike except the power plant, which will be regulated according to the patron's desire. A limited number of Mead motors will be built this coming season, while a large output of this type is planned for next year. A complete line of these cars and their motors will be exhibited at the automobile shows at New York and Chicago.

BECOMES FACTORY MANAGER.

J. M. Smith Takes Charge of Production with Henderson Motor Car Company.

Although organized early last summer, the business of the Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, has reached such proportions that it has been found necessary to acquire a new addition, affording 55,000 square feet of floor space. J. M. Smith has been appointed factory production manager.

Mr. Smith is not new in the automobile field, having been employed in one of the large Detroit factories for several years as assistant superintendent in charge of production. He also spent three seasons with the Chatham Motor Car Company of Canada as production manager, and comes to the Henderson company from the Cole Motor Car Company, Indianapolis, where he has been factory manager.

J. M. Smith, Factory Manager, Henderson Motor Car Company.

Shortly before the new year the Henderson factory was closed to enable an inventory of the various departments and to rearrange the machinery, etc., in the new addition. An increased force of workmen began operations at the conclusion of this brief respite, and it is announced that the production will be doubled for January and February, and still further increased later in the season.

SECURES ADDITIONAL EQUIPMENT.

Cincinnati Time Recorder Company Proves a Factor in Automobile Industry.

The Cincinnati Time Recorder Company, Cincinnati, O., which has been engaged in the business of producing time recording devices for the past nine years, is proving a decided factor in the automobile industry, through the manufacturing of time clocks and systems which are applicable to the public and private garages. The cost accounting features of these instruments are of decided benefit to the operator of commercial vehicles, as well.

Since taking up this work the demand has been increased by large proportions, until the company recently found itself in a position where it was experiencing difficulty in keeping up with the orders. New equipment, which is expected to enable it to meet with all demands for some time to come, has been installed at an expenditure of $25,000, and with the opening of the new year the company announces it will be able to fill all orders promptly.

BRIGHT SUCCEEDS HESS.

Latter Sells His Interest in Hess-Bright Concern to German Company.

F. E. Bright has become president of the Hess-Bright Manufacturing Company, following the purchase of all the stock owned by Henry Hess, by the Deutsche Waffen and Munitions Fabriken, Berlin, Germany, maker of D. W. F. ball bearings. He was formerly vice president and treasurer and now holds the controlling interest.

A. T. Bruegal is secretary and C. L. McCalla is treasurer of the concern. The German parent factory is being increased and extensive improvements to the American plant are being made.

MOTOR HAULAGE EXPERT.

C. T. Myers Leaves General Motors Company to Become Special Consulting Engineer.

Cornelius T. Myers, who for the past two years has been mechanical engineer and chief engineer of the General Motors Truck Company, Detroit, maker of G. M. C. trucks, has severed his connection with the company. He is returning to the consulting work which he dropped to assist President Neal in caring for some of the engineering problems then confronting the General Motors Company.

When Mr. Myers completes some special work which he now has on hand, he will be in a position to carry on a consulting engineering practise in all lines of automobile activity, but particularly in the motor truck field. Among other things, he will make a specialty of reports to prospective purchasers on their local condi-

Digitized by Google

tions with respect to the mechanical transport and on the particulars of the various machines on the market. His office is at present located at 49 Pingree street, Detroit.

PROMOTE RAMBLER MEN.

Business of the Company Makes Necessary Rearrangement of Executive Force.

With the coming of the new year several important additions have been made to the executive staff of the Thomas B. Jeffery Company, Kenosha, Wis., maker of Rambler Cross Country cars. The board of directors includes Charles T. Jeffery, Harold W. Jeffery and George M. Berry, while the officers of the company are: President and general manager, Charles T. Jeffery; vice president, Harold W. Jeffery; second vice president and treasurer, George M. Berry; secretary, Edward S. Jordan; assistant secretary, Edward S. Maddock.

Some of the promotions made at the annual meeting follow: Louis H. Bill of the Pacific Coast branch, assistant general manager; Harry E. Field, formerly in the New York branch, sales manager; J. W. DeCou, factory manager; J. Bjorn, assistant factory manager; G. H. Cox, assistant sales manager. All these men have been active in the selling of Rambler cars for a number of years. The business has grown to such proportions that it was decided to enlarge the executive force to cope with it, and those responsible for the immense growth of the concern were naturally chosen for promotion.

STEWART-WARNER CORPORATION.

Additional Details Concerning the Purchase of Large Speedometer Concerns.

Following the brief announcement of the organization of the Stewart-Warner Corporation under the laws of Virginia, which was made in the last issue of The Automobile Journal, the new concern has made public certain of its plans. The capital stock is fixed at $11,000,000, of which $10,000,000 is common and $1,000,000 7 per cent. cumulative preferred, redeemable at 110, preferred both as to dividends and assets.

The corporation has purchased the entire capital stock of the Stewart & Clark Manufacturing Company, Chicago, maker of Stewart speedometers, and the Warner Instrument Company, Beloit, Wis., producer of Warner Auto-Meters, as well as all of the speedometer patents owned by the last named company, C. H. Warner and J. K. Stewart.

The officers, directors and sales force of the Stewart and Warner companies will remain as before, and the product of each factory will be marketed separately. J. K. Stewart will be president of the new company, and C. B. Smith secretary and treasurer. The board of directors will be composed of representatives of the selling interests and of the banking house which financed the purchase.

NEW CARBURETOR FACTORY.

Inventor Locates in Los Angeles After Long Distance Test Over the Road.

A new factory for the manufacture of the Jensen carburetor has just been established at Los Angeles, Cal., being located at 2413 South Grand avenue. The inventor is A. Rasmus Jensen of Milwaukee, Wis., who recently, with Mrs. Jensen and Otto S. Nick of Milwaukee, drove from that city to Los Angeles to test the product over the various mountain and valley roads. Although the trip was through eight states, the carburetor was not touched once during the journey.

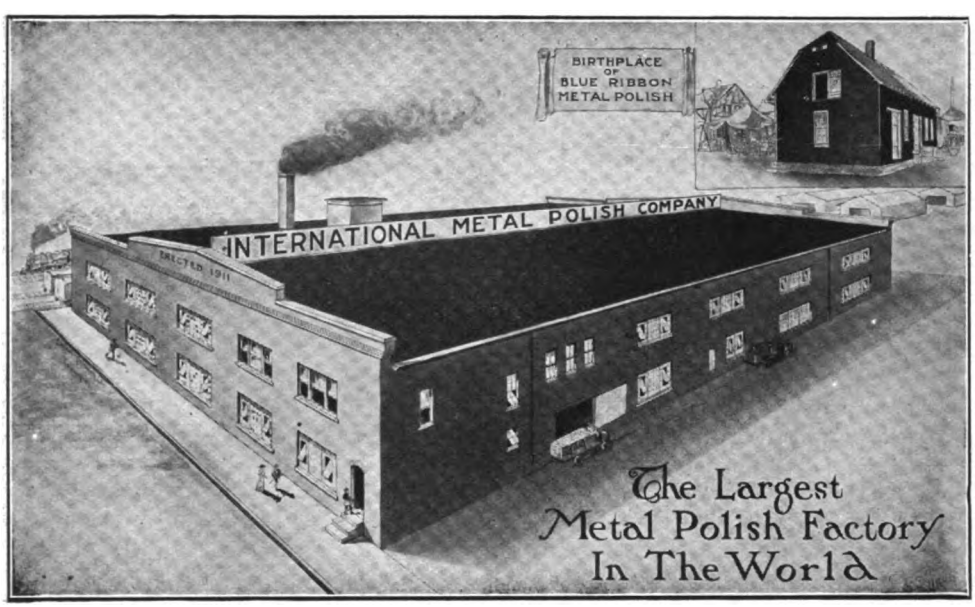
Mr. Jensen has decided to locate his factory in California, with the result that the present quarters were secured immediately upon his arrival at Los Angeles. Free demonstrations are made to all who are interested in the invention. The carburetor is said to be absolutely automatic in its action, adjusting itself to heat and cold and to all changes of altitude, as well as to low and high speed of the motor. The mixture is controlled entirely by a thermostat, which expands and contracts under varying conditions, controlling automatically the amount of gasoline and air admitted to the intake manifold.

PARKER BECOMES PRESIDENT.

Elected to Head National Gas Engine Association at Its Convention in Indianapolis.

The National Gas Engine Assocation recently held a three-day convention in Indianapolis, Ind., and various matters of interest to the organization were considered. On the last day the annual election of officers was held and in the evening the convention closed with a banquet, at which G. T. Briggs of Wheeler & Schebler presided.

Following are the officers elected: President, O. C. Parker, La Crosse, Wis.; vice president, R. A. Oglesby, Indianapolis; treasurer, Otto M.



Digitized by Google

Knoblock, South Bend, Ind.; secretary, H. R. Brate, Lakemount, N. Y.; executive committee, Otto M. Knoblock, South Bend; R. A. Oglesby, Indianapolis; M. H. Walker, Chicago; M. A. Loeb, Cincinnati, O.; O. C. Parker, La Crosse; E. J. Perkins, St. Joseph, Mich.; O. B. Isles, Indianapolis; H. W. Bolens, Port Washington, Wis.; C. O. Hamilton, Elyria, O.

NEW CARTERCAR MEN.

Several Changes in Personnel of Department Heads in Pontiac Concern.

The Cartercar Company, Pontiac, Mich., maker of Cartercar machines, is said to have made several changes in its factory organization.

Indicating Growth of International Metal Polish Company, Indianapolis, Ind., During the Past Eight Years.

A. C. Leverton, formerly with the Brush Runabout Company, has become works manager, succeeding J. J. Hartley, who goes to Philadelphia. A. A. Lehr, formerly with the Studebaker Corporation, has succeeded H. D. Evans as purchasing agent, and W. D. Block, recently with the Detroit office of the General Motors Company, becomes comptroller.

Donald M. Ferguson, who was formerly connected with the Studebaker Corporation, has been made chief engineer, E. J. Farkas having resigned to open an office of his own at Detroit. Harry R. Radford, who has been general manager for some time, and who is well known throughout the industry, will continue in that important position.

EIGHT YEARS OF GROWTH.

What It Has Done for Manufacturer of Blue Ribbon Metal Polishes.

Accompanying illustrations present the two extremes in the business life of the International Metal Polish Company, Indianapolis, Ind., the insert being a view of the building in which R. A. and Eugene Blackburn began the production of Blue Ribbon metal polishes eight years ago, while the main portion of the picture shows the present factory, said to be the largest in the world devoted to this purpose. It may be stated that the original small factory soon proved too small to meet the demand for the product, and for a time some of the work was accomplished under tents.

The new building is of concrete fireproof construction throughout and is well located on Quill street and the Belt railroad. It is of two stories, with 30,000 square feet of floor space, and the shipping facilities are such that the conditions are held to be ideal in this respect. As a further indication of the growth of the company it may be added that branches are located in the Moffalt building, 335 Broadway, New York City, and 1033 La Salle avenue, Chicago, while the Weinstock Nichols Company, San Francisco, acts as branch distributor on the Pacific Coast.

Blue Ribbon polishes are made for metal, varnish and other purposes and are handled by leading jobbers in all cities. The company also enjoys a large export business. They will be exhibited at New York, Chicago and Boston.

WILL DISTRIBUTE DRY CELLS.

Halliwell Concern to Take Over Entire Product of Standard Carbon Company.

The Halliwell Company, Los Angeles, Cal., of which C. E. and W. H. Halliwell are proprie-

Digitized by Google

tors, has closed a big contract with the Standard Carbon Company of the same city, for its entire output of dry cells. The contract calls for the delivery of 3000 dry cells a day and these will be marketed through the different branches of the Halliwell Company.

To take care of this business two electrical specialty salesmen have been added to the Halliwell force. F. E. Overhiser will look after the country business, while A. E. Ravenscroft will handle the city trade.

ONLY ONE BID FILED.

Standard Motor Company Said to Be Reorganized United States Motor Company.

Only one bid was opened by Judge Hough of the United States District Court at New York City, Jan. 8, at the proposed sale of the United States Motor Company and its five subsidiaries. This bid was $7,080,000, made by Henry G. Holt and William McAllister, representing the reorganization committee of the company. That amount was offered in a lump, or an alternative of a percentage of the liabilities to be paid the creditors of each company. Judge Hough took the bid under advisement and announced that he would make known his decision a few days later.

It is understood that the Standard Motor Company, Inc., recently incorporated under Delaware laws with a capital of $31,000,000, will become the reorganized United States Motor Company. The incorporators include Daniel Muhleman, New York City; Herbert E. Latter and William J. Maloney, both of Wilmington. Of the capitalization $11,000,000 is 7 per cent. cumulative first preferred stock, $9,000,000 6 per cent. non-cumulative second preferred, and $11,000,000 common.

It is stated that for five years the new stocks will be placed in the hands of Charles H. Sabin, Harry Bronner and James C. Brady as voting trustees, and voting trust certificates will be issued in lieu of stock. A syndicate headed by Hallgarten & Co., New York City, has agreed to purchase for $5,720,996, the voting trust certificates representing the stock allotted to shareholders who have assented to the reorganization plan made public in October.

According to report, when the sale of the United States Motor Company has been completed and that concern is taken over by the new Standard Motor Company, Walter E. Flanders will be made president and general manager. The other officers will be: Vice president, W. F. McGuire; treasurer, Carl Tucker; comptroller, M. L. Anthony. The full board has not yet been decided upon, but it will be composed chiefly of the members of the reorganization committee, it is said.

HINDLEY GEAR COMPANY.

Organized to Take Over Manufacture of Worm Gearing of Hindley Type.

The designing and manufacturing of worm gearing of the Hindley type, which has been a branch of the business conducted by the Otis Elevator Company, Philadelphia, Penn., has been discontinued by that company as such and since Jan. 1 has been made by the Hindley Gear Company, a corporation organized under the laws of Pennsylvania.

The increase in this line of work has reached such proportions that the Otis Elevator Company's officials believed their customers would be better served by having a separate concern take care of the Hindley worm gearing, particularly in view of the increased demand for this type in commercial vehicles. It is understood that the Otis Elevator Company is behind the new corporation formed to manufacture these gearings.

NEW STUDEBAKER TRUCKS.

Plans Laid for Enlarged Production of Both Gasoline and Electric Vehicles.

The Studebaker Corporation, Detroit, maker of Studebaker pleasure and commercial vehicles, will greatly increase its commercial department for 1913 and will manufacture a complete line of gasoline and electrically propelled motor trucks. During 1912 the company produced more motor driven commercial cars than ever before in its history and the output this year is expected to greatly exceed this.

A complete line of electric trucks and two new gasoline machines are to be on exhibition at the New York shows and as soon as the company succeeds in completing its truck manufacturing organization, it will market complete lines from light delivery wagons to trucks of six tons capacity, including all the intervening types, both gasoline and electric. The latter vehicles have, to a large extent, been redesigned and one model is equipped with worm drive.

The Savannah Automobile Club wishes to secure the Grand Prize and Vanderbilt Cup races for 1913.

RICH BODY DESIGNS AT IMPORTERS' SALON.

LUXURIOUS body designs, rather than mechanical innovations, marked the 1913 salon of the Importers' Automobile Alliance in the Hotel Astor, New York City, Jan. 2-10. This should not be taken as indicating that there was nothing new in the constructional details of the foreign cars on display, but it may be held that the very complete reports of the Olympia show in London and the Automobile Salon in Paris, which reached this country previous to the opening of this exhibition, left little to be expected in this line.

There were approximately 75 cars and chassis on display, these representing the products of 10 manufacturers. Among them was the Keeton, made by the Keeton Motors, Ltd., Brantford, Ont., and this is held to be the first time that a Canadian built machine has been shown in this country. The other nations represented were Austria, Belgium, France, Germany and Italy.

Undoubtedly the chief interest of a majority of the visitors at the salon centred in the attractive body equipment. American and foreign coach builders vied with each other in producing artistic color effects and satisfying lines. It may be held that there was a strong tendency toward lower roofs for the closed cars, these being with curves which were intended to blend into the entire assembly in a pleasing manner. Many of the designs were decidedly new in this country, and this was especially true of the European made bodies, the idea being to reflect some of the latest features in vogue abroad.

The Austro-Daimler was shown by Healey & Co., and was of special interest because of its initial appearance in an American salon. Three cars were on exhibit, the largest being an 80 horsepower roadster, termed a Terraplane, said to be a duplicate of the machine which won the Prince Henry trophy. Its aluminum body was painted gun metal black, and the peculiar shaped windshield and pointed radiator gave it a decidedly novel appearance. The others were the 27 horsepower touring car which won the Alpine tour of 1912, and a 60 horsepower touring car.

The De Dion-Bouton was presented in three polished chassis and seven completed cars by the De Dion-Bouton American Agency. The leader was the 30 horsepower eight-cylinder model mounted with a Holbrook landaulet limousine body, in which the interior work was in rosewood and mahogany. Underneath the cowl was a locker, and the extra wire wheel was carried in a pocket on the front fender. A cabriolet body from abroad, an excellently equipped physician's phaeton, a 100 horsepower red touring car with a body by Burr & Co., an inside driven coupe and a six-passenger touring body with individual seats, also were included in this exhibit.

Four cars and a chassis comprised the Isotta-Fraschini display by the Isotta-Fraschini Motor Company. Three of the cars were fitted with pressed steel wheels, and all were equipped with the brakes on both front and rear wheels. Undoubtedly the most interest attached to the 120 horsepower motor, which was utilized in a touring car. Another offering was a curved roof limousine for five passengers, the finish being in green, black and nickel, and the upholstery in green broadcloth. A four-passenger touring car with separate seats, and a victoria, the latter with red danger lights set in the rear fenders and the sidelights in the front fenders, also called for special attention.

The Adams-Lancia Auto Company showed a number of interesting bodies on the 30 horsepower Lancia chassis. A town brougham, built on the straight line effect, with the frameless glass windows so arranged as to drop completely out of sight and with removable roof, vied with a runabout, a coupe, a landaulet and limousine by Holbrook, a limousine by Brewster and a touring car by Rothschild. The chassis was designed by Vincenzo Lancia, well known in this country as a racing driver of decided prominence, and the car attracted considerable attention by reason of this fact.

The Metallurgique, shown by the Metallurgique Motor Company, was represented by four complete cars, the body work all being the product of Van den Plas of Brussels. The 40 horsepower De Luxe limousine was with rosewood and mahogany finish inside, this including the ceiling as well. Concealed curtains matched the upholstery and the collapsible top over the driver's seat was arranged to be folded away when not in use. A special torpedo touring car was with one large door on either side, the inside being finished in mahogany and the exterior in ivory enamel. The other models were a touring car and a laudaulet.

The Minerva exhibit, by the Minerva Motors Company, contained two new evening cars, said to be the latest conception in France. One of these was a limousine by De Ruytter, in which the upholstery was a Du Barry rose brocade, with pillows and robes to match. A gold fitted toilet case at one side and a satinwood adjustable toilet

Digitized by Google

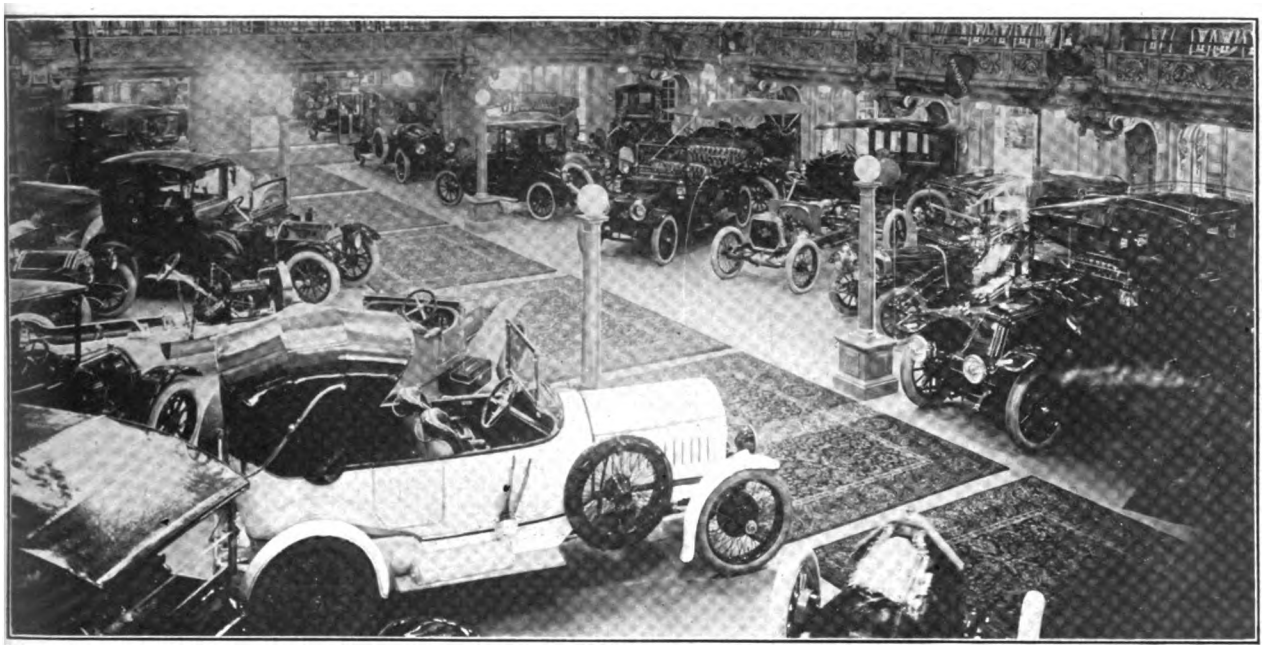

table at the other, were made to harmonize perfectly with the other appointments. The exterior was in diamond gray. The second car had a maroon body and was upholstered in French gray satin brocade. Two other complete cars also were shown. All Minerva chassis were fitted with Knight motors and the smaller machines were worm driven.

Knight motors also were fitted to the Panhard cars, shown by the Panhard & Levassor Selling Branch. One of the features of the display was a body of Richelieu blue with ivory stripe, and the upholstery in tan. An innovation was the foot space under the cowl on either side for the comfort of those riding in the extra seats. The car also had a door light to illuminate the step. A touring car was with cane top and mahogany tool cases, and was fitted with a glass ventilator in the cowl, the purpose being to insure comfort for the occupant of the front seat in warm weather. Other bodies were by Kellner, and one of these, a coupe, was particularly pleasing.

The Renault, displayed by the Renault Freres Selling Branch, was represented by eight complete cars and two polished chassis. One of these was a Muhlbacher coupe with a leather extension top over the driver, designed so as to button onto the framework over the windshield. A seven-passenger limousine by Kellner was in dark blue, with upholstery in tan covert cloth. Among the appointments was the toilet case in one side and the smoker's outfit in the other, and the inside dome light so arranged as to illuminate the step upon entering.

The centre of attraction at the Mercedes exhibit, made by the Mercedes Distributing & Importing Company, was the 90 horsepower machine with which Ralph De Palma won the Vanderbilt cup and the Elgin trophy. Another car was an eight-passenger limousine upholstered in French frissette. The third seat closed against the front member and was so arranged that it might be swung to face forward or backward.

The Keeton exhibit consisted of a six-cylinder chassis and a four-passenger touring car. The construction was held to follow the practise in vogue in France very closely and the body work also was considered to be of foreign design.

View of the Grand Ball Room, Hotel Astor, New York City, During the Progress of the 1913 Importers' Automobile Salon.

Special body constructions were shown by Holbrook & Co., Locke & Co., and J. M. Quinby & Co., aside from those displayed upon the cars in the show. A new limousine landaulet by Locke was with claret colored body and interior finish in Circassian walnut and tan broadcloth. It was supplied with toilet case and smoker's outfit and had a large luggage rack at the rear.

Among the aluminum bodies displayed by Quinby was an ivory colored touring car upholstered in maroon leather. The seats were especially deep. Another feature was a new windshield of distinctive design. This company also exhibited a three-seated enclosed coupe, the outside of which was finished in cane work.

THEFT OF AUTOMOBILE.

Three Indictments for Grand Larceny Secured by Cleveland Club.

Although police authorities in Cleveland, O., have maintained that the theft of an automobile was merely a violation of the motoring law and was not an offense punishable by a term in the penitentiary, members of the Cleveland Automobile Club and others in that state have long contended otherwise. The matter has now been brought to a point where the question will be determined by the courts and the club has secured a signal victory as a result.

Recently three young men drove away the car of Mason B. McLaughlin, sales manager of the White Company, maker of White machines. The police court held that the offense did not furnish the basis for an indictment, and the matter was taken to County Prosecutor John A. Cline by Richard N. Lee, attorney for the Cleveland Automobile Club. Dec. 20, three indictments were handed down charging the young men with grand larceny.

BILL GIVES BROAD POWER.

Takes Away Right to Drive for Operating Car While Under Influence of Liquor.

Among the first bills to be filed with the Massachusetts legislature at the present session was one introduced by Representative Fred P. Greenwood of Everett, which provides that a person convicted of operating an automobile while under the influence of liquor shall be liable to imprisonment for not less than 30 days nor more than one year, and shall forfeit his license forever. There does not appear to be any special provision for the first offense.

Representative Greenwood also has introduced a bill prohibiting the use of a device upon automobiles by which the operator may shut off the tail light without leaving his seat.

AMENDMENTS IN TEXAS.

Dallas Club Interested in Provisions for Theft and Universal Lighting.

At a recent meeting of the Dallas Automobile Club, Dallas, Tex., all the representatives-elect in the county were present to discuss with some 75 members of the organization, proposed amendments to the motoring law of that state. The subject of good roads legislation also was brought up. The amendments provide as follows:

1—To make the use of a motor vehicle on a public highway without the consent of the owner a crime punishable by imprisonment for not less than one year nor more than seven years.

2—That vehicles using the public highway after dark shall display a light of sufficient character to make them known at a distance of 200 feet, front and rear.

CALIFORNIA'S PROPOSED LAW.

San Francisco Assemblyman Expects It to Yield at Least $500,000 a Year.

The Automobile Club of California is taking deep interest in the bill introduced into the legislature of that state by Assemblyman Milton L. Schmitt of San Francisco, who hopes the commonwealth will benefit to the extent of $500,000 a year in license fees, etc. At present the registration fee in California is nominal.

The Schmitt bill provides the following schedule of fees: Cars of 25 horsepower and less, $5; 25-35, $10; 35-50, $15; more than 50, $20; motorcycles, $2; commercial vehicles, $5. Vehicles, other than those used exclusively for commercial purposes, licensed for more than four consecutive fiscal years, are thereafter to be registered at one-half fees.

Digitized by Google

A similar bill failed to meet the approval of the governor last year. Motorists objected to its provisions because old cars were compelled to pay the same fees as new ones. It would appear that an attempt were made to cover this point in the four-year clause and copies of the bill are being sent to owners in an effort to secure their approval of it.

MANY CHANGES IN NEW YORK.

Twenty-One Amendments to So-Called Callan Law Have Been Filed Already.

Included among the 21 proposed amendments to the so-called Callan motoring law in New York State, are those providing for a state prison sentence for operating a car while intoxicated, and requiring applicants for driving licenses to permit finger prints to be taken. The list follows:

Requiring all persons who operate motor vehicles, including owners, to be examined as to their qualifications and licensed.

Making it a misdemeanor, punishable by a fine of $250 or imprisonment for six months, or both, for operating without a license, and making it a misdemeanor for an owner to permit an unlicensed operator to drive his machine.

Making it a misdemeanor to operate a car which has not been licensed or on which no number plates are displayed.

Including motorcycles within the meaning of the term motor vehicle.

Providing that in cities of the first class no license shall be issued without the approval of the commissioner of police.

Giving the secretary of state power to refuse any application for registration or license, the applicant to have recourse to the courts.

Giving the secretary of state the right to suspend a registration or license for cause, after a hearing, subject to review by the courts.

Providing that no person under 18 years of age shall operate a car on the public highway.

Making operation by an intoxicated person a felony, punishable by imprisonment only, and carrying with it revocation of license or registration.

Providing for a uniform speed limit.

Prohibiting local ordinances with reference to speed.

Empowering the secretary of state to appoint inspectors to co-operate with police in the enforcement of the motoring law.

Giving the secretary of state authority to require applicants for license to permit prints of fingers to be taken.

Providing for imprisonment as well as for fines for violation of law.

Requiring manufacturers and dealers to notify the secretary of state within 24 hours of the name and address of the person to whom a motor car has been sold.

Restricting the use of manufacturer's number plates to demonstration purposes and the removal of a car from place to place for sale.

Providing for a uniform flat rate for registration and renewals, of 50 cents a horsepower or part thereof, with a minimum fee of $5.

Providing for a registration fee of $2 on motorcycles.

Giving non-residents the right to operate their cars in the state if licensed to operate in their home states and numbers are displayed.

Defining a non-resident as one who shall not continuously maintain his car within the state for a period greater than 60 days.

Providing that garage owners shall keep a record of all cars which enter and leave their garages.

WEST VIRGINIA BUSY.

Seeks to Eliminate Intoxicated Drivers and Wants Manufacturer's Licenses.

A new motoring law has been drafted for presentation at the legislative session in West Virginia. It is understood that it will receive the support of the automobile clubs of the state, and is said to be patterned closely after the laws in New York, Pennsylvania and New Jersey.

Heavy penalties are provided for driving a car while intoxicated, using a machine without the consent of the owner and other acts which tend toward so-called joy riding. Another new feature is the provision for a manufacturer's license, so that concerns making cars in this and other states may not use the roads in West Virginia for testing purposes.

GIVE IMPROPER SIGNALS.

Maintained That Traffic Officers in Boston Fail to Aid Motorists.

According to a large number of motorists who have occasion to drive in Boston, Mass., some of the police officers stationed at important congested traffic points fail to aid operators in the proper observance of the law. It is maintained that these traffic officers often carry their hands at the side and make signs with them while in that position which are interpreted as indicating that the motorist shall proceed, but drivers who have followed this plan claim to have found that the signs were possible of misinterpretation.

The complaints have been decidedly numerous of late, and it is suggested by those who have experienced difficulty in this respect, that traffic officers should do all in their power to assist automobile operators in complying with local regulations. This is particularly true when visiting motorists are to be considered, as it will be found that nearly all operators are extremely anxious to assist in every way in an attempt to relieve congestion.

Mr. and Mrs. Albert Seamon of New York City have been enjoying one of the longest and most unique motor camping trips of the past season, travelling 4278 miles through 23 states of the Union, including every state east of the Mississippi except Florida. Their equipment consisted of two tents made of the best balloon silk. The average cost of the trip figured out at 2.43 cents a mile and the gasoline consumption at 15 miles to the gallon.

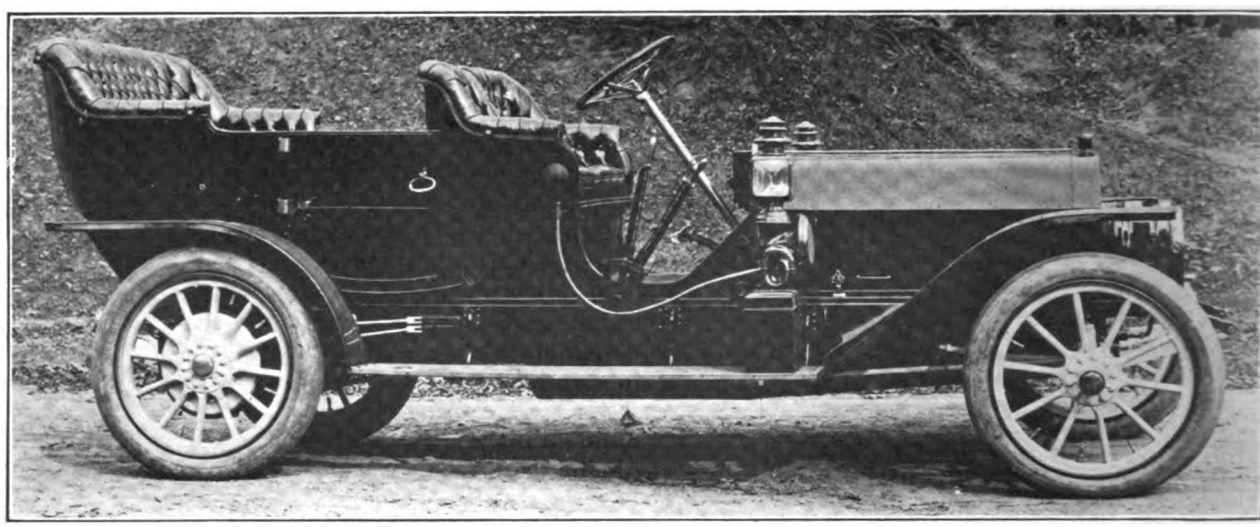
EQUIPMENT FEATURE OF 1913 MODELS.



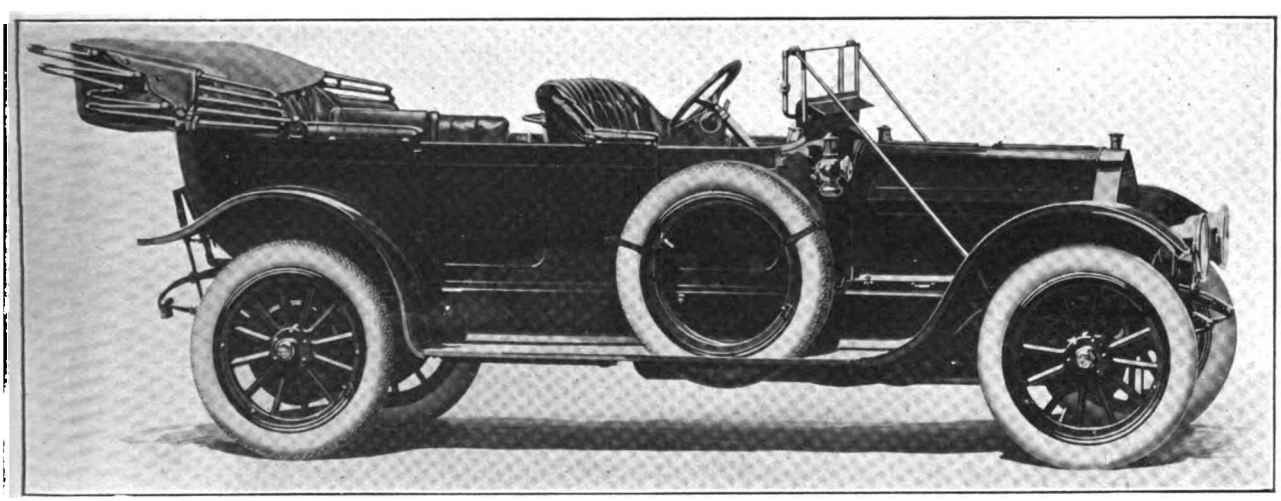
THE equipment of an automobile is always of vital interest to the prospective purchaser whether an experienced motorist or otherwise. From the early announcements of the manufacturer it was very evident that the 1913 model would be fully equipped, including in addition to time and labor saving devices those features making for comfort and convenience.

The completeness of the equipment and the method of its installation promise to be among the features of the coming shows, and while it may be expected that the maker of the high priced machine will provide every possible convenience, it will be noted that the producer of the moderate priced car has supplied a complete and practical equipment as well. The buyer of the modern automobile is progressive and demands those fittings formerly listed as extra. While it is not anticipated that the popular priced vehicle will have the same accessories as the more expensive machine the purchaser does expect that these will be practical and serviceable.

In analyzing the 1913 equipment it will be noted that the majority of makers are fitting some form of motor starter and that many who listed the labor saving device as extra or optional last season are including it as standard. Last season the compressed air and acetylene starters were favored, but the electric unit appears to have received the indorsement of the industry in that about 50 per cent. of the new models are thus equipped. This should not be taken to mean that the advocates of the other forms have lost ground; in fact, the compressed air method, for instance, will be found upon several high grade cars. The increase in the electrics may be held to be due to the general adoption of electric lighting and the fact that the generator and motor starter may be a combined unit.

Electric lighting, considered a novelty a few years ago, and a strong talking point of the manufacturer last year, has passed the experimental stage and is now standard equipment, being fitted to the moderate priced car and even to some of the popular priced type. The greater number of the systems include a generator for supplying current to the lamps direct and with the battery utilized as an auxiliary, or employ the cells for a source of electricity, the dynamo maintaining them in a properly charged condition. And it is noticeable that those makers who are not fitting the dynamos are in many instances meeting the demand for electric lighting by installing batteries of ample capacity for this purpose. One of the advantages of the electric lighting equipment is that the battery current may be utilized for ignition if desired and some makers have discarded the magneto, employing a special type of distributor. A high degree of efficiency has been attained in battery construction and maximum service is now possible with minimum attention. Economy is effected, in that the purchaser of a new machine is not obliged to install dry cells or a battery for starting purposes as formerly.

The manufacturer is more liberal in the matter of tires and rims. Many cars now come



Illustrating What Was Considered Standard Equipment a Few Years Ago, Comprising Acetylene Headlights, Oil Side and Tail Lamps, Horn and Tools.

Digitized by Google

equipped with anti-skid shoes and in some instances these are fitted to each wheel. Option of several makes are given. Demountable rims, either of the quick detachable or clincher type, are standard, with a tendency to utilize those of the former design. In the matter of extra rims some makers include two and the majority of machines make provision for the carrying of spares, the tire irons being fitted at the factory.

It may be said with truth that 1913 is to be a big tire year. With the addition of numerous accessories not formerly listed as standard, the shoes are subjected to additional weight and many makers have increased their size accordingly, in some instances beyond the stated maximum carrying capacity. This ample margin of safety not only makes for a decidedly more comfortable riding car but economy of upkeep, an important factor in maintenance. Heretofore the motorist often has added equipment weighing hundreds of pounds without giving due consideration to the maximum capacity of the tires.

An Example of the Equipment Found on the 1913 Machine Including a Wide Selection of Accessories Formerly Listed as Extra.

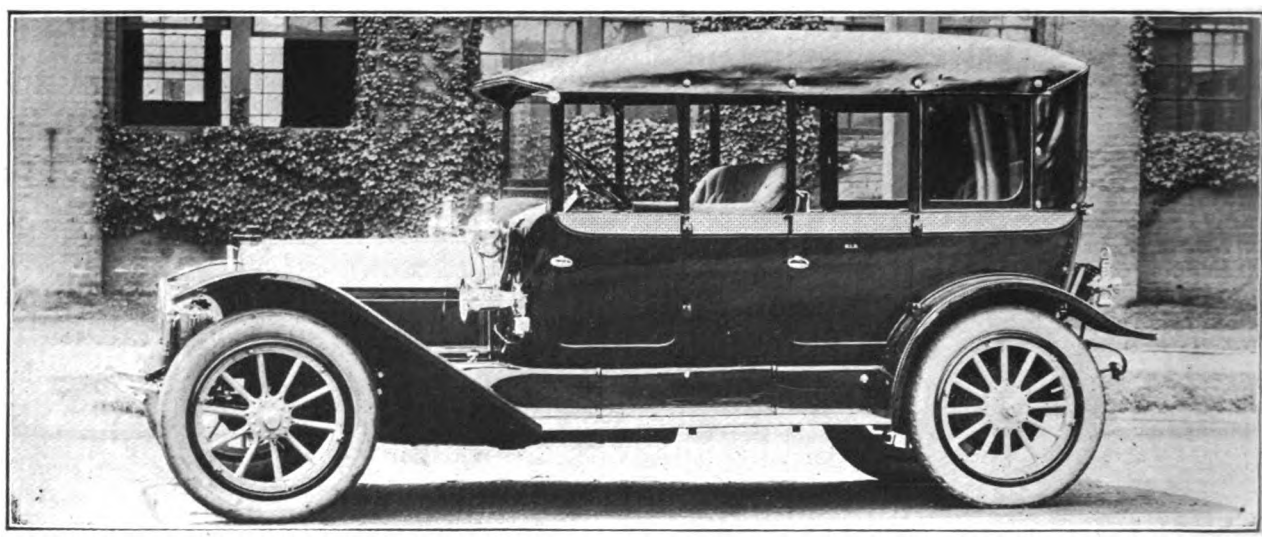
While tops are now standard the buyer is receiving more value for his money than in the past. The decision of the manufacturer to include the top assures the purchaser of a design that is not only practical, but one that will harmonize with the appearance of the machine. Among the improvements noted in top construction are designs which may be raised and lowered by one person, quickly operated curtains and storm fronts. The increasing number of owners driving the entire year has been responsible for the fitting of the touring car with weather proof designs, and due attention has been given to lighting the interior of the body.

Windshields, speedometers and signalling devices are standard and some models include both an electric and a bulb horn to comply with the varying laws of different states when the motorist is touring. While some utilize current from dry cells, many employ that from the battery of the lighting system, another factor making for economy. Although tool and battery boxes have been included in the past, there is a growing tendency toward a clean running board and as a result considerable ingenuity is displayed by the manufacturer in the storing of the tools, pump, jack and spares. Accessibility has not been overlooked and the driver is not obliged to disturb the passengers when these are needed. While tool rolls are still utilized many machines carry the tools in drawers in compact departments. And it is noticeable that the tool equipment is very complete and of high grade material.

Touring is no longer a novelty and many makers cater to this class of motorists by fitting trunk racks and trunks; in fact, even the moderately priced roadster or runabout is provided with a trunk at the rear of the seats. Concealed baggage carrying compartments are provided, while foot and robe rails will be found on many machines. Fitting the number plates has always been a source of annoyance and cause of trouble through improper location, but the problem has been solved by the maker supplying serviceable brackets or devices for attaching the plates and in accordance with the laws. In some instances the holders are combined with the tail light or rear signalling device. Shock absorbers are no longer considered a luxury and a number of machines are fitted with some form as standard equipment.

Numerous devices making for comfort and

Digitized by Google



convenience of operation will be seen this season. While the reserve gasoline tank serves the purpose for which it is intended, there is a growing tendency to install a fuel gauge on the dash in plain view of the operator. Similarly, provision is made for noting the amount of lubricant, either by a gauge on the dash or on the power plant.

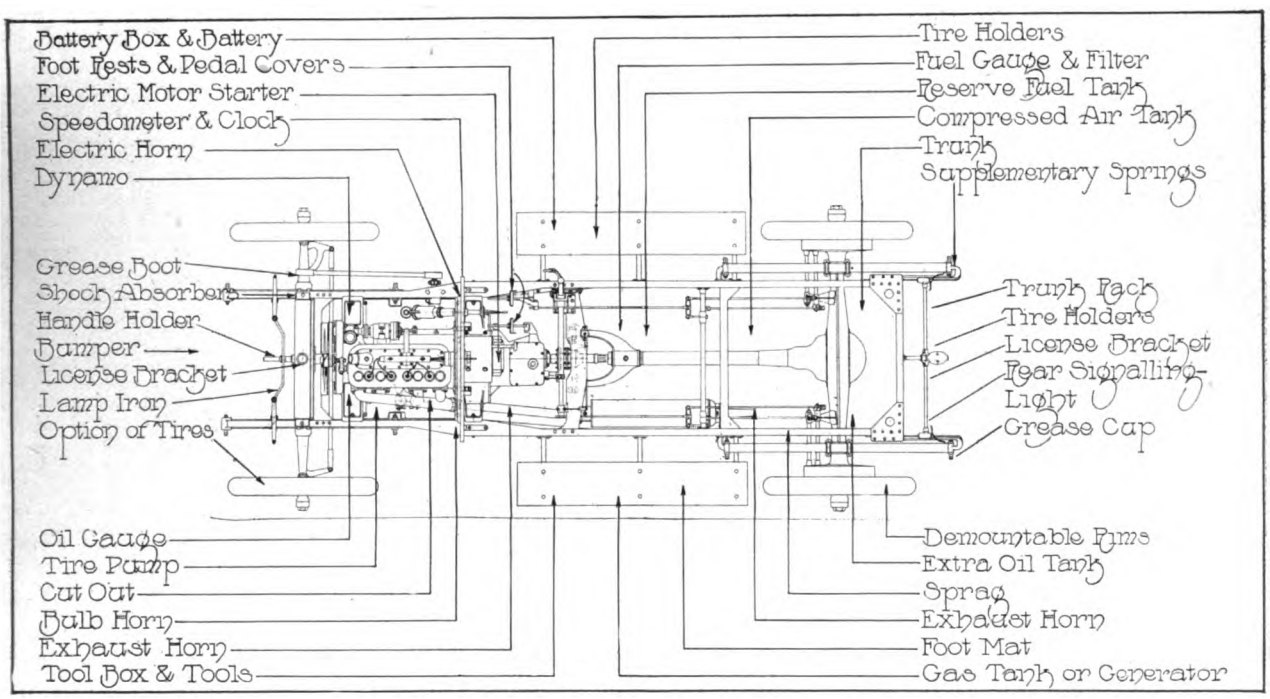
In the matter of time and labor saving devices, there is an inclination on the part of the manufacturer to install power tire pumps, relieving the owner of the arduous work in inflating the tires by hand. While the demountable rim eliminates much of this work it is possible that several punctures may occur, necessitating the removal of the shoe and the fitting of a new tube. With the power pump considerable time is saved, to say nothing of energy, and these members are included in the regular equipment on some models. Starting handle holders, grease boots, clocks, grade recording devices, mirrors enabling the operator to note approaching vehicles from the rear, foot and running board mats are considered as necessary by some makers and listed accordingly.

The motoring public is demanding comfort and what formerly was considered deep upholstery appears otherwise when compared to that utilized today. Cushions 12 and 14 inches deep and luxurious backs are often standard, and some makers fit adjustable members. More attention is paid to the width of the seats and between them with the result that long rides are accomplished without tiring.

In the installation of the equipment and accessories the manufacturer has displayed considerable ingenuity. The adoption of the fore door type of body and tendency toward clean running boards has resulted in concealing the control and operating members, but with attention to the convenience of the driver. By utilizing the dash or footboard the operator is enabled not only to start the motor and control the lights from the seat, but to adjust the carburetor as well. The fuel and oil gauges are similarly located, as are the voltmeter and ammeter for noting the condition of the lighting system.

The appearance of the convertible body, which is being adopted by some producers, makes it possible for the motorist to maintain two bodies at the expense of one, as the design may be changed readily into a completely enclosed body or a touring car. While it cannot be classed under the head of equipment it serves to demonstrate the possibilities of the industry.

An Exemplification of the Completely Equipped Motor Car, Having Every Possible Accessory Making for Convenience of Operation and Comfort of Passengers.



When the fittings of the modern car are compared with those of a few years ago it readily will be seen that the buyer is receiving considerable more value for his money. This not only applies to the accessories, which formerly meant the outlay of several hundreds of dollars, but to the machine itself. The industry has made wonderful progress within the past few years and while automobiles are not cheaper, high grade material and workmanship are incorporated. Systemized manufacturing, improved machinery and the utilization of new alloys have enabled the maker to build at the same cost a higher grade car than in former years when the equipment was incomplete. Production in large quantities has

Digitized by Google

made it possible for even the maker of the low priced vehicle to include in the selling price a practical equipment.

The factory equipment of the automobile is of decided advantage to the buyer, in that the selection and installation of the accessories and fittings means better material, better workmanship, more effective devices and a more attractive car. Before announcing certain fittings as standard equipment these are given exhaustive tests with the result that the buyer receives the benefit of the experience of the maker, to say nothing of an assured efficiency and durability.

And it will be very evident that the purchase of a 1913 model will involve no other expense than the cost of filling the fuel and oil tanks, and

Showing What May Be Termed a Complete Equipment, Representing the Saving of Hundreds of Dollars to the Purchaser—Note the Decided Contrast to That Considered Standard a Few Years Ago.

the license, in decided contrast to the conditions a few years ago, when two oil side lights, a tail lamp, horn and a set of tools were considered standard equipment.

The New England Motor Supply Jobbers will enjoy a lunch, to be followed by a business session, in the Prince George hotel, Boston, Mass., Wednesday afternoon, Jan. 15, at 1. J. J. Kelleher of 22 Trescot street, who has charge of the arrangements, announces that all details have been completed and that an interesting meeting is assured. It is anticipated that there will be a full attendance.

MEETINGS DURING THE SHOW.

Usual Number of Gatherings to Mark Exhibition Weeks in New York City.

Several of the organizations in connection with the automobile industry make it an annual practise to hold business and social sessions in connection with the national automobile show in New York City. This year will be no exception, as may be indicated by the accompanying list of such events:

Monday, Jan. 13—Executive board, American Automobile Association, Hotel Belmont, afternoon.

Tuesday, Jan. 14—Annual meeting, Automobile Board of Trade, morning; executive committee, Motor & Accessory Manufacturers, morning; finance committee, M. & A. M., morning; board of directors, M. & A. M., afternoon; annual dinner to pioneer automobile manufacturers, given by Big Village Motor Boosters, at Murray Hill Lyceum, evening.

Wednesday, Jan. 15—Midwinter session, Motorcycle Manufacturers' Association, Hotel Breslin; 10th annual meeting and fifth annual banquet, Motor & Accessory Manufacturers, Waldorf-Astoria, afternoon and evening.

Thursday, Jan. 16—Meeting, Society of Automobile Engineers, Hotel McAlpin, morning, afternoon and evening; dinner in honor of W. H. Blood, Jr., given by Electric Vehicle Association of America, at Delmonico's, evening.

Friday, Jan. 17—Meeting, S. A. E., morning and afternoon, and annual dinner, evening.

Saturday, Jan. 18—Meeting, S. A. E., morning.

A bill introduced in the New York legislature provides for combining all automobile insurance in one contract.

CLEVELAND OPENS NATIONAL SHOW CIRCUIT.

Splendid Setting and Large Attendance Greets Initial Attempt of Manufacturers to Assist Local Dealers at a Minor Display---Plans in Other Cities.

OVER 7000 persons attended the 11th annual automobile show in Cleveland, O., on the opening night, Jan. 4, and inspected over 200 motor cars and innumerable accessories which were on exhibition. The Cleveland show was the first of the season on the national circuit and its success was even greater than had been anticipated by the committee in charge. Sixty-one makes of cars were represented. The scenic spectacle of the show was extremely beautiful. A gorgous sylvan vista was presented down long lanes of trees with the displays most attractively arranged, while visitors were apparently threading the mazes of a forest. The light was soft and yet wholly adequate. A lagoon just within the entrance to the Euclid square building on East 13th street, near Euclid avenue, added to the charm of the spectacle.

The exhibitors were liberal in their praise of the committee in charge of the exhibition which was composed of the following: Chairman, Hobart M. Adams of the Peerless Motor Car Company; vice president, H. W. Barger of the Rambler sales department; secretary, Fred C. Wood, president of the Cleveland Automobile Club and connected with the Oakland sales department; treasurer, Clarence M. Brockway of the Winton sales department. Good business was transacted throughout the week, which was of importance not only in automobile circles alone, but to the citizens of Cleveland as well. Following is the full list of exhibitors:

Pleasure Cars.

Parrish Motor Car Company, Packard; Peerless Motor Car Company, Peerless; Pullman Motor Car Company, Knox; Rauch & Lang Carriage Company, Rauch & Lang electrics; Reo Motor Sales Company, Reo; Richardson Motor Car Company, Cole; Lucas & Christenson, Mitchell; Mercer Automobile & Supply Company, Mercer; Michigan Motor Branch, Michigan; Neighbors Motor Car Company, Hupmobile; W. H. Barger Company, Rambler; Cleveland Cadillac Company, Cadillac; A. R. Davis Motor Company, Studebaker; E. B. Finch, Chalmers; Franklin Auto Company, Franklin; V. R. Hall Automobile Company, Cartercar; Hamilton Motor Car Company, Chevrolet; Lozier Sales Company, Lozier; R-C-H Corporation, R-C-H, Hupp-Yeats electric; Standard Electric Car Company, Standard electrics; F. B. Stearns Company, Stearns-Knight; Stevens-Duryea Company, Stevens-Duryea; Stutz Cleveland Motor Car Company, Stutz; Weaver Twelvetree Company, Pierce-Arrow, Flanders, Premier; Western Reserve Motor Car Company, Garford; The White Company, White; Winton Motor Car Company, Winton; Ford Motor Company, Ford; Northern Ohio Motor Company, American, Marion; Oakland Motor Company, Oakland; Abbott Motor Car Company, Abbott-Detroit; Oldsmobile Company, Oldsmobile; Auto Sales Company, Overland; Anderson Electric Car Company, Detroit electrics; R. M. Allen, Paige, Westrook, Brunswick, Velie; Benting Machine Company, Toledo, O., Paterson; Baker Electric Motor Vehicle Company, Baker electrics; Broc Electric Vehicle Company, Broc electrics; Buick Motor Company, Buick.

Commercial Vehicles.

Henry E. Riker & Co., Stewart; Chicago Pneumatic Tool Company, Ltitle Giant; A. R. Davis Motor Company, Studebaker; International Motor Company, Mack, Saurer; Sandusky Auto Parts & Truck Company, Sandusky; Weaver Twelvetree Company, Pierce-Arrow; Western Reserve Motor Car Company, Garford; The White Company, White; Ford Motor Company, Ford; Baker Electric Motor Vehicle Company, Baker electrics.

Accessory Exhibitors.

Blackburn Specialty Company, auto-lock switch; Browning, King & Co., wearing apparel; Burke Valve Company, Burke tire valves; Casino Cycle & Supply Company, motorcycles; Cleveland Speed Indicator Company, speedometers; Eberhardt-Naab Company, metal welding; Electric Products Company, electric charging plant; Euclid Oil Company, Havoline oils and greases; Walter A. Frese & Co., National rims; Higbee Company, trunks and sundries; H. W. Johns-Manville Company, band lining, rims and plugs; Johnstone Auto Lock Company, combination locks; K. V. Motorcycle Company, Henderson motorcycles; A. M. Larwill, O'Taka tire remover; Lister Motorcycle Company, motorcycles; Theodore P. Meinhard, J-M shock absorber; Chas. E. Miller, accessories and sundries; L. J. Mueller, Indian motorcycles; National Motor Supply Company, pumps and vulcanizers; National Refining Company, oils and greases; Norwood Tire Company, tires; O'Neil Tire & Protector Company, inside tire protectors; Perfection Spring Company, springs; Presco Manufacturing Company, lamps; Scarborough Company, motor guides; Sharp Spark Plug Company, spark plugs; I. H. Silsby, motorcycles; Standard Oil Company of Ohio, lubricating oils and greases and storage tanks; Visco Motor Oil Company, oils; V-Ray Company, V-Ray spark plugs and Liberty bells; Horsey Manufacturing Company, cement patches.

PHILADELPHIA PLANS COMPLETE.

Separate Displays for Pleasure Cars and Trucks but in One Building.

It has finally been decided to hold the 12th annual Philadelphia automobile show Jan. 18-Feb. 1, in the new building of the Automobile Club of Philadelphia, between Market and Chestnut streets, instead of in two National Guard armory buildings as in recent years. In the club building about 90,000 square feet of space will be available and the show will be under the direction of the Philadelphia Automobile Trade Association, comprising nearly 90 per cent. of the dealers in Philadelphia.

The show committee contemplates a sub-division of the show, mainly along the lines followed last year, including gasoline pleasure cars, motor trucks, both gasoline and electric, electric pleasure cars, motorcycles and accessories. The last named will be given a full opportunity for dis-

Digitized by Google

play as more space will be available. The pleasure car show will be held Jan. 18-25, while the commercial vehicle exhibit will open Jan. 27 and continue to Feb. 1.

BIG SHOW AT MILWAUKEE.

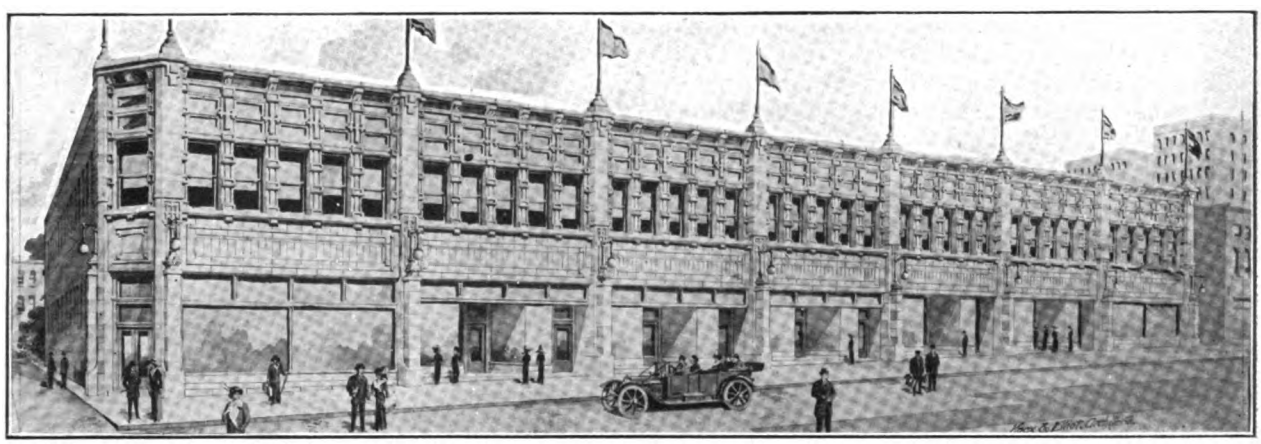
Auditorium Will House Nearly All Makes Seen at National Displays.

Th fifth annual Milwaukee Auditorium exhibit, Jan. 11-17, will have every make of car, except 16, seen at New York City. The list of cars to be on exhibition in Chicago exceeds Milwaukee's representation by only 11, as announced by the management of the Coliseum.

The Milwaukee display, as the first of the western shows this year, will be the greatest success in the history of that city. Thursday, Jan. 16, about 800 Wisconsin dealers will meet in the Auditorium in the third annual convention of the Wisconsin State Automobile Dealers' Association, and at the same time there will be a meeting of the Wisconsin Automobile Owners' Association, which will bring several hundred representatives to Milwaukee for inspection of the show cars. The color scheme of the decorations will be steel gray and the embellishment will be in gold bronze and grass green. Sketches of motoring life enter into the effect.

LYNN DEALERS ACTIVE.

Plans Completed for Second Annual Show in State Armory Jan. 20-25.



The Automobile Dealers' Association of Lynn, Mass., has made plans for its second annual show to be held at the state armory in that city, Jan. 20-25. The opening night will be known as City Government night, Wednesday will be Society night and Friday Military night.

The project is meeting with the heartiest cooperation of the dealers, who at their recent meeting elected the following officers for the association: President, Harry M. Doane; first vice president, Warren H. Beede; second vice president, Sidney H. Barrett; secretary and treasurer, Percy I. Reynolds.

TWO DISPLAYS IN PROVIDENCE.

Dealers Crowded Out of Regular Exhibition Form Independent Organization.

Despite the provisions for additional floor space made by the Rhode Island Automobile Dealers' Association for its second annual show in the state armory, Providence, R. I., Jan. 25-Feb. 1, no less than 11 local dealers have been unable to secure allotment. As a result, an independent organization, to be known as the Motor Car Dealers' Association, has been formed to hold a separate display in the Narragansett hotel during the same week.

Euclid Square Building, Cleveland, O., Where the First Show of the National Circuit Was Held, Jan. 4-11.

Arthur S. Lee, who is manager of the regular exhibition, at which at least 35 makes of automobiles will be represented, is sparing no expense to make this display one of the most impressive yet held in New England outside of Boston. The decorative scheme, the design for which was accepted after months of consideration, calls for the introduction of original Japanese art direct from the Orient, and is said to be patterned after the Imperial court at Tokio.

Pleasure cars will be shown on the main floor, while the trucks will be located in the basement. A departure from last year's plan will place the

Digitized by Google

accessories by themselves in a separate department at the right of the main entrance. This will permit of utilizing some 38,000 square feet for exhibition purposes.

It is understood that the independent movement is to compete in no other way with the regular association, as none of the officers are members of the Rhode Island Automobile Dealers' Association. These officers are as follows: President and general manager, H. F. Farrell; vice president, Henry H. Kendall; treasurer, Franklin Nichols; secretary, Robert L. Knight.

MORE ROOM AT DETROIT.

List of Exhibitors Makes Necessary Addition of Annex to Wayne Gardens.

The Detroit show for 1913 will be on the national circuit and therefore greater in importance than the display of last year, as the exhibits shown at New York City will be moved westward to Detroit, thence to Chicago and Minneapolis. This is expected to bring to Detroit all the best exhibits to be seen at Madison Square Garden.

Work is being done in the annex to Wayne Gardens, where a portion of the show will be held Jan. 27-Feb. 1, and it is probable that next year it will be necessary to build a two-story annex, instead of one. Manager Walter Wilmot at his office at 501 Bowles building is working hard perfecting the details of the coming exhibition.

THREE BUILDINGS FOR ROCHESTER.

Splendid Provision Made for Accessory Men in This Year's Exhibit.

Three of the buildings at Exposition park, Rochester, N. Y., have been engaged by the Rochester Automobile Dealers' Association for the annual automobile exhibit, which will be held Jan. 27-Feb. 1. These are known officially as Nos. 3, 4 and 5. Building 3 is to be devoted to accessories, while 4 and 5 will be given over to automobiles. The entrance will be at one end of building 3 and exhibitors and the public must walk the length of accessory hall to reach the automobile display, thus insuring a good attendance for the accessory men.

The buildings furnish an aggregate floor space of 78,000 square feet and the show will be carried out on an elaborate scale. The association has elected these officers: President, F. W. Peck; vice president, C. E. Hartson; treasurer, F. R. Luescher; secretary, George J. Bauer; executive committee, the above and H. P. Gould, A. V. Hart, A. M. Zimbrich, A. R. McKenney, C. E. Sager, H. G. Strong, Robert Thomson, Arthur McNall and Paul LeHardy. These committees were appointed: Music, Messrs. Sager, Luescher and Strong; poster, Messrs. McNall, McKenney and LeHardy; decoration, Messrs. Hartson, Luescher, Gould, Thomson and Hart.

SHOWS IN OTHER CITIES.

Large Number of Displays Planned for Leading Centres of the Country.

The Albany Automobile Dealers' Association will hold its show in the state armory, Albany, N. Y., Feb. 15-22, and the dealers in Schenectady, Cohoes, Troy and other neighboring cities will assist in the preparations. A special feature will be the truck exhibit, which will be located in the basement and at which over a dozen separate displays will be made.

The Automobile Dealers' Association in Pittsburg, Penn., is considering the possibility of securing Machinery hall, in addition to Exposition hall for the annual display in that city, March 1-8. Forty dealers are working hard for the success of the enterprise and it is stated that over $40,000 will be expended in making the necessary preparations.

T. Oliver Probey is chairman of the show committee in charge of Washington Automobile Dealers' Association display in Convention hall, Washington, D. C., Feb. 3-8. Already a large number of requests for space have been received, and the representatives of 26 different makes of cars have contracted for booths. A feature of the entertainment programme will be afternoon and evening concerts by the Marine band.

Advance information concerning the annual show in Newark, N. J., Feb. 15-22, would seem to indicate that the commercial vehicle section will be a strong rival of the main exhibit of pleasure cars. Space reservations are coming in rapidly and the closing date for these has been set for Jan. 23.

So numerous and persistent have been the requests for space for the annual display of the Brooklyn Motor Vehicle Dealers' Association in the 23rd Regiment armory, Feb. 22-March 1, that the show committee is trying to devise some plans whereby additional floor space can be secured. One of the features of the display will be the placing of all cars on the main floor, making it unnecessary to climb stairs to visit the entire exhibit.

Digitized by Google

Owing to the fact that the annual inspection of Company C, Third Infantry, N. Y. N. G., in Syracuse, N. Y., is scheduled for March 19, the Syracuse Automobile Dealers' Association has been forced to postpone the opening of its annual show from March 18 to a later date. Manager William R. Marshall has suggested a week during the latter part of February, which will bring the exhibition almost a month earlier than heretofore.

The fifth annual automobile show of the Automobile Dealers' Association of New Orleans, La., will be held at Washington Artillery hall, Feb. 19-23. As in the past T. C. Campbell will manage the event and the committee to assist him is composed of Ginder Abbott, Joseph Revol, Gus D. Revol, J. A. Landry and Lucien Lyons, Jr.

Preparations for the second annual show at Ottawa, Can., Feb. 11-15, under the direction of the Ottawa Valley Motor Car Association, are being made. Howick hall has been secured and the show will be fully 50 per cent. larger than that of last year. Louis Blumenstein has been engaged as manager and it is stated that not only will American and Canadian cars be shown, but British and French makes as well. A large section has been reserved for accessory exhibits.

The Toledo Auto Shows Company, Toledo, O., has started a publicity campaign and already this is beginning to achieve results. Although the coming show will have nearly double the floor space of the one last year, the greater part of it has been drawn. President J. G. Swindeman, Vice President Guy R. Ford, Secretary H. W. Blevins, Treasurer A. A. Atwood and Director T. H. Deardorf are greatly pleased with the outlook for the exhibition and the way the dealers have subscribed for space.

At Portland, Me., the annual show will be held Feb. 17-22, and not only the local dealers, but many of those from out of the city have made requests for space reservations. A large number of exhibitors will display their 1913 cars and the show is expected to exceed all previous events of the kind.

A. P. Pierce is this year's manager for the annual automobile show at Bangor, Me., which will be held in the Auditorium Feb. 24-March 1. These dates have been selected in order to give the dealers who exhibit cars at Portland the week before an opportunity to display them at Bangor as well. The Chamber of Commerce is co-operating with the show management and special rates have been secured from the railroads.

The show at Minneapolis, Minn., to be staged Feb. 10-15, is one of the most important on the national circuit, inasmuch as Minneapolis is at the very door of a territory in which there are large opportunities for automobile trade. The National Guard armory has been secured and the Minneapolis Automobile Trade Association, which has charge of the show, will have over 40,000 square feet of space for the event. Every inch of space has been taken and every dealer in Minneapolis is represented, in addition to numerous outside exhibitors.

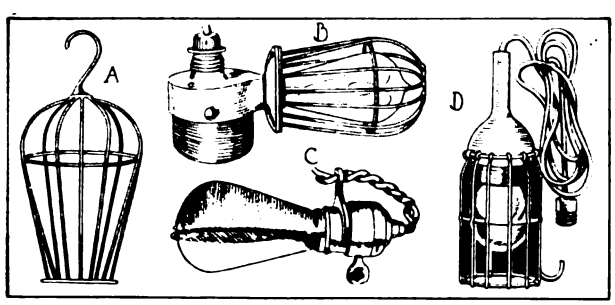
The second annual show of the Paterson Automobile Trade Association will be held in the big armory, Paterson, N. J., Feb. 24-March 1, and already there has been a brisk demand for the 104 spaces set aside for exhibitors. President E. A. Browne of the association and Thomas Hughes, chairman of the space committee, have charge of the arrangements.

The annual show of the Sioux City Automobile Dealers' Association, Sioux City, Ia., will be held March 3-8 and efforts are being made to secure the Auditorium for the event. It is estimated that the cost of changing the Auditorium for the show and restoring it afterward will be about $2000.

The fourth annual show of the Des Moines Automobile Dealers' Association, Des Moines, Ia., will be a two weeks' exhibition, the first week, March 3-8, being given over to pleasure cars, and the second week, March 10-15, devoted to commercial vehicles. This will be the first time a complete commercial car show has been attempted in Iowa.

The Stratfield hotel, Bridgeport, Conn., one of the largest hotels in New England, has been selected as headquarters by the Automobile Club of Bridgeport. The house has 275 rooms, 260 of which are supplied with baths, and makes a specialty of catering to the wants of motoring parties.

The Olds Motor Works, Lansing, Mich., celebrated New Year's with a house party at the factory, General Manager Oliver C. Hutchinson having invited all branch managers throughout the United States to visit the home office for this purpose. The object was to discuss past and future policies of the company, and to acquaint the branch managers with the features of the new light six-cylinder Oldsmobile.



Two Stutz cars, made by the Ideal Motor Car Company, Indianapolis, are the first to enter for the 500-mile Memorial Day race in that city.

Digitized by Google

EQUIPPING THE GARAGE.

One of the problems confronting the new purchaser of a motor car is its storage. This applies particularly to the motorist who resides in the suburbs and who utilizes the machine in going to and from the office or place of business. Cost of maintenance is an important factor and when practical to erect a garage upon the premises it will be found a decided economy in many ways. In addition to the saving in storage expense, the home garage permits the owner to attend to the upkeep of the vehicle, and the cost of this may be reduced to a minimum if the building is supplied with suitable tools and the equipment essential for work of this character.

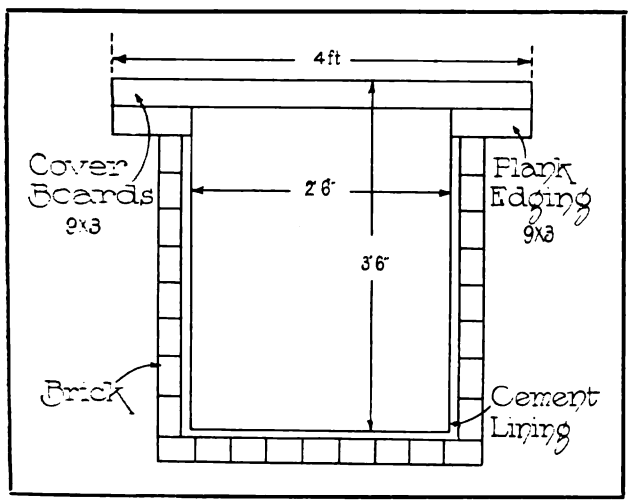
Hand or Inspection Lamps Are Essential to the Garage Equipment: A, Type Utilized in Repair Shops; B, Magnalamp, an Electrical Device Self-Adhering to Metal by Means of Self-Contained Magnet; C, Magna Clip and Reflector Useful Over Work Bench; D, Inspection Member.

The dimensions of the garage are important and some motorists make the error of economizing in cost at the expense of space. Irrespective of whether the garage is home made, built under contract, or of the portable or take-down type, in which there is opportunity for a wide choice in design, it is essential that the dimensions be such that there shall be room to work around the machine, as well as to store the material required for its operation and upkeep. The extra cost of providing for the necessary room warrants the increased expense and economy is effected in the end, in that much work may be done that otherwise would have to be performed outside.

Floor Material and Pit.

While cement is conceded to be the ideal material for a floor, concrete or wood may be employed, the construction depending upon the owner. Cement over a proper foundation makes for durability and is easily cleaned. Wood has the disadvantage of being stained readily by lubricants, while some forms of concrete also are difficult to keep clean.

Irrespective of the floor material due consideration should be given to the pit; that is, if the motorist proposes to attend to his own repairs, in which event a pit will be found a valuable addition, saving considerable time. By it adjustments may be made to the motor without lying upon the floor and when properly designed the work of taking up connecting rods, bearings, etc., may be performed comfortably.



A working plan for a pit is presented in an accompanying illustration, in which the dimensions and material are outlined. While at first glance it may appear expensive, it could be constructed at a reasonable figure. It possesses the advantages of being very durable and easily cleaned. The depth may be altered to suit the height of the workman, that given in the drawing being three feet, six inches, which is the average of the standard pits. A width of two feet six inches will be sufficient to permit of moving about without undue cramping, while the length may be four feet.

The retaining wall is constructed of ordinary brick, laid flat, and is erected to within six inches of the floor level. The bottom of the pit is also of brick. After the mortar has set the pit is lined with any durable cement. Planks, nine by three inches, are utilized to form the support for the cover boards which are of the same dimensions. These are secured together and a ring fitted to

Digitized by Google

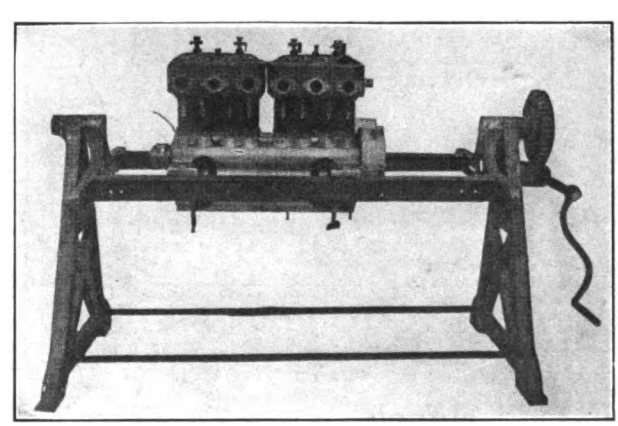
enable the cover to be removed and replaced. The cover should be flush with the floor.

Another and cheaper method is to make a box

Outlining Working Plan of a Brick and Cement Pit.

of heavy planking of the desired dimensions and paint the outside with a creosote preparation to preserve the wood from moisture. A design of this type could be constructed easily and the interior cemented. A small pair of wood steps can also be made to facilitate getting into and out of the pit and when not in use the steps could be left in place.

Type and Arrangement of Lights.



The subject of lighting is important, whether day light or an artificial illuminant is to be used. The windows of the building should be ample in size and sufficiently low to permit of working about the chassis in the day time without artificial light. Electricity is the ideal illuminant in the garage and the wiring plan should be given careful consideration. The number of lights will be determined by the size of the building, but as the cost of one or more extra sockets is not prohibitive it is well to make provision for these. An overhead lamp of ample capacity or a cluster having a good reflector is desirable and the control switch should be located conveniently so that the interior may be illuminated when driving in at night. A number of sockets on both side walls and on either side of the machine are invaluable and these should be provided with the snap type of socket permitting the utilization of one or more as desired. If the car be washed at night the side lamps will be of decided convenience.

One or more drop lights should be suspended by an adjustable cord over the work bench and these ought to be equipped with shaded reflectors. There is a wide opportunity for choice in the latter and they are not expensive. Metal members are preferred by some as they are less liable to injury through accident. The trouble or inspection lamp should have ample length of durable cord and connecting plug, and a large number of these portable members are marketed. The globe should be protected by a removable cage having a hook for attachment to the chassis when working. There is also a form of magnetic lamp which adheres to metal when the current is turned on. This has a distinct value when working on parts to which the hook type of cage cannot be attached. In addition, the washing stand device may be mentioned, this comprising a stand having a cluster of bulbs and reflector and the height and angle of the light being adjustable as desired. While they may be purchased ready made, one having a little ingenuity can make a practical stand from an old music rack or some similar material.

Planning the Work Bench.

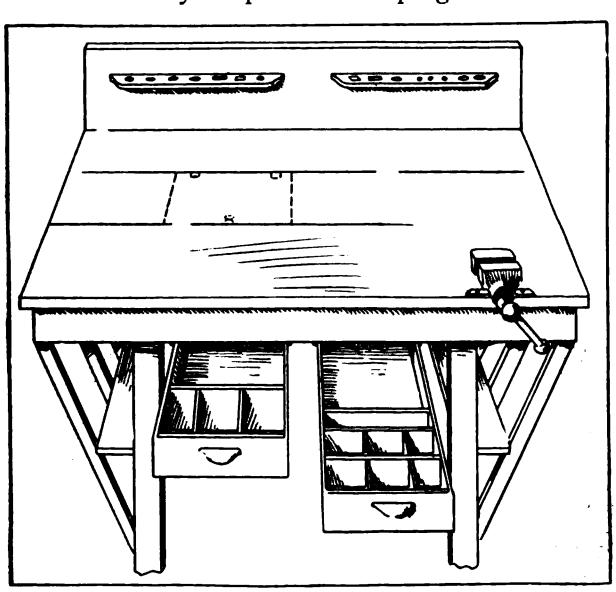
While it is a simple matter to construct a work bench those familiar with the overhaul of the motor car give the design and material employed careful consideration. It may be stated that even if the owner does not perform the work of overhauling there are times when the bench will be decidedly convenient. It should be substantial and the material strong enough to withstand the stresses to which it will be subjected when handling heavy parts.

A practical bench may be constructed at little expense if one can handle a saw, hammer and try-square, and the design may be elaborate or simple, according to the tastes of the motorist.

The Haco Motor Stand, a Design for Holding Engine in Any Desired Position by Means of Worm and Worm Gear Attachment.

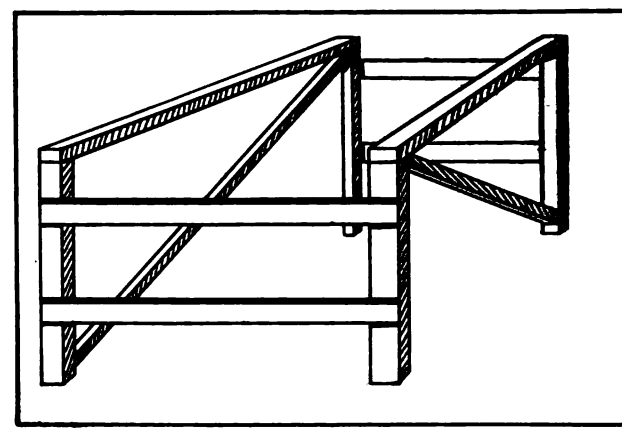
In an accompanying illustration is presented a bench which will answer all requirements, and it will be noted that provision is made for drawers

Digitized by Google



as well as shelves. These members are of value in that tools may be stored properly and parts of the car placed out of the way.

The dimensions of the design illustrated provide for a bench five feet in length, two in width and about two feet 10 inches high. These may be altered to suit individual height, convenience and requirements, the figures presented being those suited to the average person. In the matter of height it is a good plan not to have the bench proper so low that one must bend over in working.



Value of Shelves and Drawers.

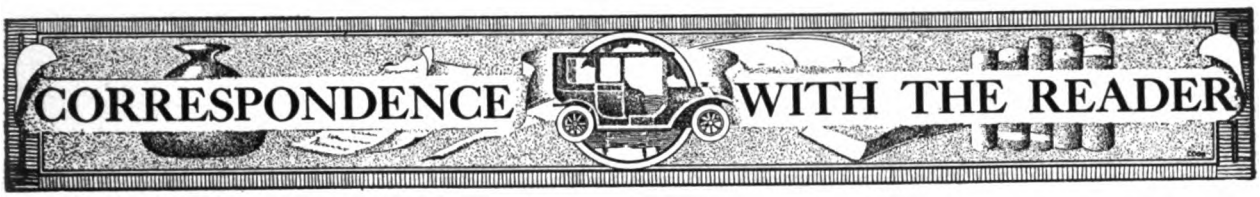
The lower shelf is approximately three feet long and two wide. The side members are nine inches wide and two feet long. It will be noted that the bench proper is fitted at the back with an extension and that provision is made for the tools. Two strips are bored to take screw drivers, files, pliers, scrapers, etc., and such an arrangement not only facilitates the work but the tools are handy when desired and economy is effected in that their cutting edges are not impaired as is the case when they are jumbled together. If one wishes to lock up certain tools, a section of the bench may be cut out and fitted with hinges and a lock.

The lumber may be planed or unfinished stock, according to taste. The planed material costs but slightly more and presents a much neater appearance. The legs of the bench should be constructed of square joists and the bench proper of material at least two inches thick. The latter should be free from knots and the planks nailed securely to prevent warping. The drawers may be made of whitewood, but they should be sturdy as in time considerable heavy material will be placed in them.

The Work Bench Should Be Substantial and Provided with Shelves and Drawers.

Form of Home Made Motor Stand Constructed from Joists.

The trays should be divided into several compartments in which the nuts, cotter pins, bolts, etc., should be separated. It is surprising to note the number of motorists and even repairmen who jumble these articles together and when a nut or bolt is wanted, lose considerable time in searching for the desired part. In the overhaul work the bench will prove useful for the various small parts may be stored on the lower shelves while the ample size of the bench proper will accommodate the cylinders and other parts requiring cleaning and attention.



Motor Stands and Supports.

Coming next to the matter of motor stands, the making or purchasing of these members will depend upon whether or not the motorist is to overhaul the power plant and chassis components. In connection with the subject of the overhaul it may be stated that the number of owners who successfully complete this work is increasing and many have become quite proficient. While there is and always will be a certain proportion of motorists who do not care or have not the time to work over their machines, the educational campaigns conducted by motoring publications and the manufacturer have led many to take up this interesting part of motoring. It has a decided advantage in addition to the economy effected in that those who are familiar with the construction and operation of these components are enabled to complete road repairs successfully.

A thorough overhaul of the motor is best accomplished by removing the unit from the frame and this also permits of inspecting the main or sub-frame.

(To Be Continued.)

Motor Starting Suggestions.

(1471)—At this time of the year we hear of all kinds of methods for starting an engine that has become chilled, such as heating the intake pipe, etc. I am enclosing a few words upon the subject, believing that they will be of interest to your readers.

When the motor will not start by employing the ordinary methods, turn the engine over several times to get some gas in the cylinders. Next, take out a couple of spark plugs and dip the ends that screw into the cylinders in gasoline. Replace plugs and crank the motor, which will start due to the gas around the spark plugs.

Another method, and one appreciated by drivers, is to prime the carburetor more than usual and crank the motor fast several times. Now we have a mixture that is very rich, but it does not get up to the spark plug, being heavy and owing to its chilled state. Open the petcocks on top of the cylinders and crank engine fast, and it will start. The cocks being open allow some of the gas to pass out, and at the same time bring it up near the spark plug which can readily ignite it.

JOHN R. LETTENBERGER.

Woodhaven, L. I., N. Y., Dec. 23.

Priming and Taxation Suggestions.

(1472)—Instead of carrying a cup of gasoline in the car for priming purposes, or making one of a dust cap as recently proposed, a better plan is to use high grade gasoline in a small oil can such as is used with the sewing machine. Squirt a little of the fuel into the air intake pipe, and in ordinary weather the engine will start very quickly. The small oil can may be supplied from a bottle of the more volatile gasoline, as may be required. On some cars, and in very cold weather, an assistant to squirt a little more gasoline after the first explosion is obtained, may be desirable. I have found the little sewing machine oil can a very great help in starting the engine in my Stevens-Duryea car in New England, and the intake pipe is more convenient than the petcocks.

It is a hopeful indication of fair play for the motorist when the fact is becoming fixed in the public mind, that the tax on automobiles is plainly a road tax, and that it is inequitable because all vehicles are not taxed alike. Granting as true that automobiles wear the roads over which they pass, it is being admitted that horses wear the roads in comparative proportions, as they did long before automobiles were ever dreamed of. And it is manifestly unjust to charge the entire cost of repair upon automobiles alone. There should be a fair and equitable tax laid upon all vehicles using the highways, instead of singling out automobiles alone, and of increasing the taxes to reach the limit of what the traffic will bear, as they do in freight tariffs. There is no justice in exacting a road tax from a motor truck for the use of the highway and allowing another truck drawn by horses to go free.

MARCUS H. ROGERS.

Daytona, Fla., Dec. 28.

Backfiring in Carburetor.

(1473)—Being a subscriber of your magazine I am taking advantage of your offer to supply information. What I would like to know is what causes backfiring in the carburetor? I saw a few write-ups on backfiring in a number of motoring magazines but I can't seem to understand them, so I would like to see what you have to say about it, as you always supply information in plain English so anyone can understand it.

WILLIAM GROUFF.

Newark, N. J., Dec. 29.

There are a number of causes making for backfiring. To understand the blowing back through the vaporizer, knowledge of the principle of operation of the internal combustion motor is important. With the poppet type of valves these members are raised from their seats by cams and other actuating mechanism, and are closed or retained upon the seats by springs. During the compression and firing strokes the valves are supposed to be firmly upon their seats. When the intake valve is open the mixture is drawn from the carburetor by the suction of the piston, and upon the completion of the stroke, the valve closes, remaining seated during the compression, firing and exhaust strokes. Similarly, the exhaust valve is supposed to be seated during the intake, compression and firing strokes. The time of opening and closing of these valves will depend upon the design of the motor, etc.

The intake and exhaust manifolds are separate members; that is, a pipe is utilized to convey the mixture to the combustion chamber and another tube for carrying away the burnt gases. As both the intake and exhaust valves open into the cylinder it is important that the valves seat properly, as well as close in their proper sequence and at the right time.

If, during the combustion of the gas, the intake valve is not fully closed, the gases in seeking to escape during their expansion, will tend to find their way out past the valve through the intake pipe, thence to the outer air by the way of the carburetor. If mixture be present in the pipe it can be ignited, producing the backfire referred to, usually denoted by a flame at the air intake of the vaporizer. This action is sometimes responsible for disastrous fires.

A weak mixture will produce a form of blowing back, as it is sometimes termed, owing to the fact that an improper quantity of air makes for a slow burning gas, and when this condition exists, as well as weak valve springs, faulty timing and ignition, etc., there is a tendency toward bringing about the backfire. If such condition exist, it should be remedied, and if the ignition be correct, joints tight, valves seating properly, etc., the carburetor should be inspected as it may be that its operation is faulty.

The city council in Minneapolis, Minn., has instructed its legal adviser to devise some means for imposing a tax on automobiles for road maintainence.

GROWTH OF PIONEER ACCESSORY HOUSE.

ONE of the committee of eight which made the arrangements for the first national automobile show in Madison Square Garden, New York City, 13 years ago, was Chas. E. Miller, pioneer dealer in automobile accessories. Soon after the appearance of the first practical gasoline machines, Mr. Miller, who was at that time and had been for some years engaged in conducting a supply house for bicycle sundries in New York City, became interested in such equipment as his judgment indicated would be suitable for use on the horseless carriage. The industry is indebted in no small measure to his business foresight in this connection.

It was during the annual bicycle show in Madison Square Garden during the fall of 1899, at which a few automobiles, loaned by their owners, were displayed as an added attraction. As a result, there arose a demand for more extended exhibition the following year, and inasmuch as Mr. Miller was well established in this location, his advice was eagerly sought and generously given in connection with the plans which led up to this initial show. Moreover, he was the third member elected by the National Association of Automobile Manufacturers.

Mr. Miller began his business with automobile accessories by selecting such bicycle equipment as could be made to apply to the new vehicles, but he was not long content with this plan. He sought out the manufacturers of special fittings, acting first as a general jobber and later as the special representative of different producers. This very naturally brought him into peculiar relations with the trade, and as foreign makers were producing accessories of undoubted value, he soon became an importer as well. Still later, as American inventors began experimentation in this field, Mr. Miller, who by this time had come to be considered more or less of a specialist, was called upon for his judgment relative to the practicability of the devices, and often saw fit to assist in their production. In this manner he became a manufacturer. And as the demand

Headquarters of Chas. E. Miller, New York City: Upper Views Indicate Convenient Appointments in Business Office; Lower, Attractive Arrangement of the Salesrooms, with the Miller Cat in the Foreground at the Left.

Digitized by Google

for American fittings and supplies was created abroad he took up the exportation of such as he felt would meet with the approval of foreign motorists.

Such, in brief, is the business history of Chas. E. Miller, jobber, importer, manufacturer and exporter. Accompanying illustrations show the interior of the Miller headquarters at 97-103 Reade street, New York City, where every detail of the business transacted in this main house and the 15 branch houses in nine states receives his personal attention. The branches are located as follows: Three in New York City, and one each in Brooklyn, Buffalo and Albany, N. Y.; Boston and Springfield, Mass.; Hartford, Conn.; Philadelphia, Penn.; Newark, N. J.; Detroit, Mich.; Cleveland, O.; Atlanta, Ga., and New Orleans, La.

In one of the accompanying photographs, Mr. Miller's black and white cat occupies a prominent position, and this is quite appropriate since this cat was brought up among the employees from a kitten, and very naturally has inherited much of the enthusiasm of the office force. It not only can sit up, retrieve and perform a large number of tricks, but the Miller establishment needs no clock to learn when it is lunch time, since it is its chief duty to announce this fact. It also includes the role of office boy, in a measure, as will be borne out by the regular patrons who have been greeted by it for years.

"Try Miller" has become a trade slogan, particularly in its application to any special line of accessories the merits of which have been firmly established, since Mr. Miller makes it a practise not to handle any except those in which he has undoubted confidence. Each of the branches is as well stocked in quality as the main store, though not as heavy in quantity, the purpose being to give the dealers of the section the benefits of the Miller purchasing methods and resources.

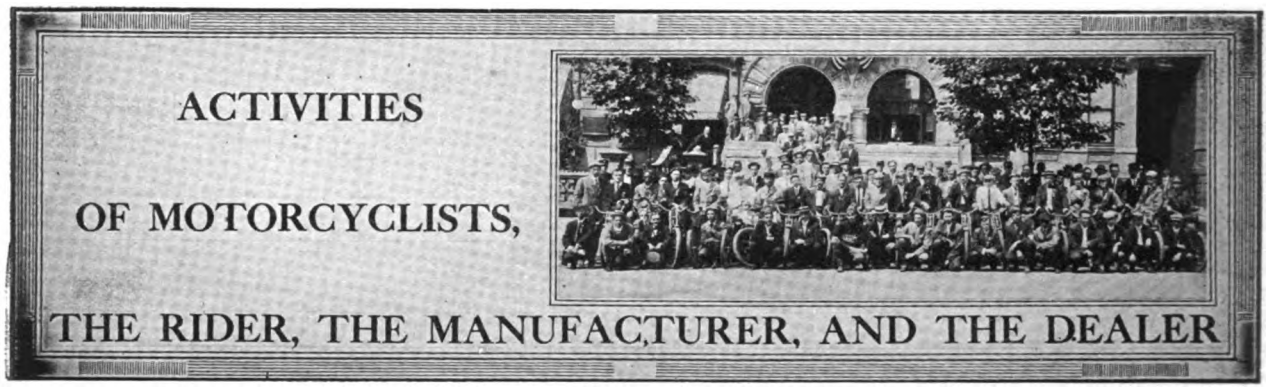
MORE SPACE AT CHICAGO.

General Manager Miles Secures Wilson Building for Overflow Department.

Many belated applicants for space at the 1913 Chicago automobile show, who have been greatly disappointed because of the lack of room in the Coliseum, Annex and First Regiment armory during either the first or second week of the display, have been given an unexpected opportunity to make exhibit. General Manager Samuel A. Miles of the National Association of Automobile Manufacturers, under whose direction the show will be held, announces that he has acquired the Wilson building, adjoining the Annex on the south, and practically the same in size. The floors are free of all obstructions and will make an admirable addition to the display room heretofore secured.

Plans for the decorative scheme for the show have been completed, and the effect will be entirely different from any previous show of this character in America. Cathedral glass and stained windows will play a prominent part in the treatment. The pleasure vehicle section will be held Feb. 1-8 and the commercial car section, Feb. 10-15. The list of exhibitors as reported this week, indicates the following: Pleasure cars, 102; business vehicles, 77; accessory concerns, 244.

BOSTON SHOW IN MARCH.



Plans Perfected for Industry's Largest Exhibit in Two Sections in March.

Mechanics building, Boston, Mass., which for the past 10 years has housed the big Boston automobile show, will again this year present two separate exhibits. The pleasure car division of the industry will be represented during the week of March 8-15 and following this, from March 19-26, will be held the exhibition of commercial vehicles. The first show will be under the direction of the Boston Automobile Dealers' Association, Inc., while the truck display will be under the management of the Boston Commercial Motor Vehicle Association, Inc.

In the pleasure car division many new body designs will be seen and the show promises to surpass anything of its character ever held in this country. With the whole of Mechanics building at its disposal the Boston Commercial Vehicle Motor Association also will be able to present a thoroughly interesting exhibition. In connection with the truck show this year a special department will be set apart for the machine tool display. It has been impossible to do this industry justice in past years owing to lack of space, but the whole of department C will be devoted to it this year. Manager Chester I. Campbell has prepared an entirely new decorative scheme and is now busy receiving applications for space at his office, 5 Park square, Boston.

Automobiles, valued at more than $1,000,000, have been stolen in New York City during the past five years, according to insurance statistics.

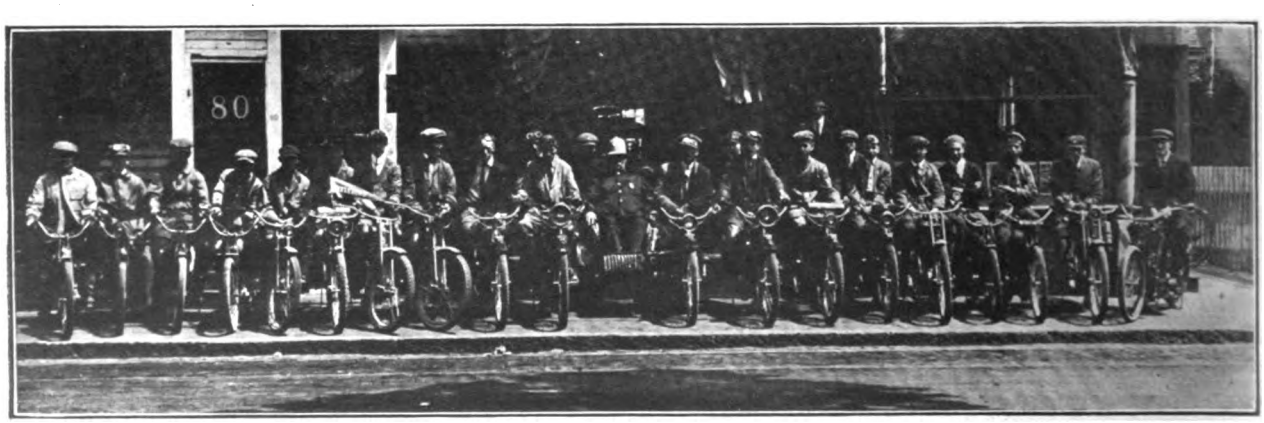
The New York Show.

Motorcycle enthusiasts cannot help but agree with the manufacturers in appreciating the fact that these vehicles are to be shown in New York this year in connection with the pleasure car display. Not only is this true, but the position assigned to this portion of the exhibition is much better than heretofore. The mounts and sidecars will be housed on the Depew place side of the Grand Central Palace, where ample room will be at the disposal of the exhibitors and wide aisles will aid the visitors in examining the machines.

Elsewhere in this issue will be found a full list of the exhibitors in both buildings, with the motorcycle makers classified by themselves. It will be found that 19 separate makes will be on display, not to mention those who will devote their attention to the exhibition of sidecars and tricars.

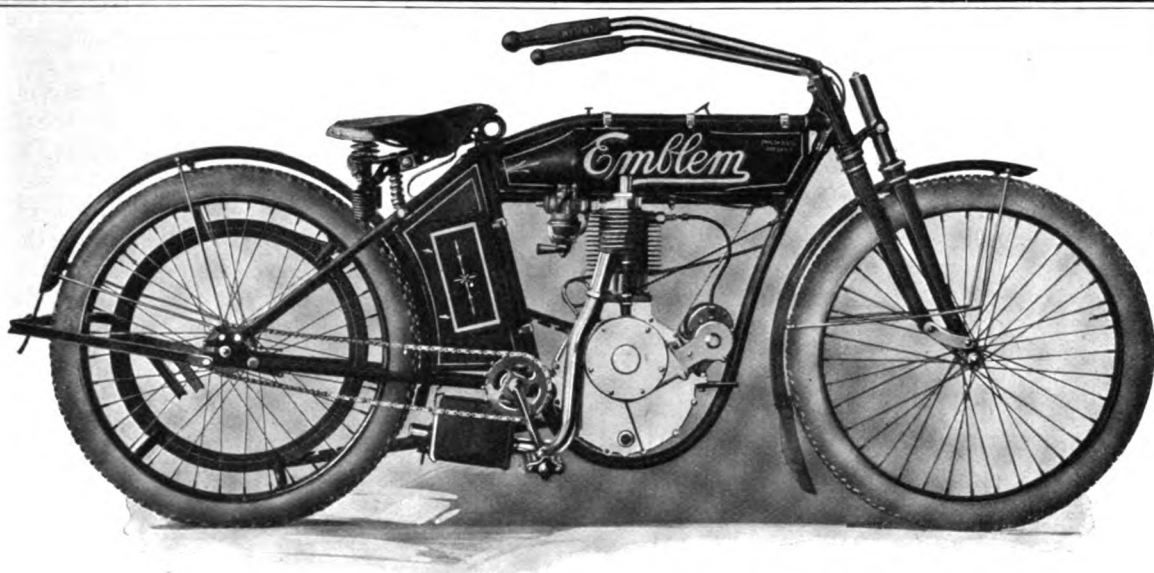
The New Emblem Twin.



Although the Emblem Manufacturing Company, Angola, N. Y., announced a new twin of 10 horsepower a short time ago, it is expected that a large number of people will have their first opportunity to study its features fully during the New York show. It may be stated that it has all the Emblem characteristics, with the exception of its larger size.

However, this has a wide meaning, since all Emblem models have undergone improvements and refinements. Supt. J. C. Glas has been particularly interested in the design and construction of the cam case, which is held to make for simplicity and compactness. Such changes that have been found necessary are along lines which give even more sturdiness than heretofore and larger capacity in every way. The new twin is sure to draw the attention of all motorcycle enthusiasts to the Emblem booth.

Wide Awake Club in Attleboro.



An accompanying illustration presents several members of the Attleboro Motorcycle Club, Attleboro, Mass., ready for a day's spin into the country. The club is composed of enthusiasts who take advantage of every opportunity to get away from home and enjoy the beauties of southeastern Massachusetts and Rhode Island. A rendezvous which attracts their attention quite as often as any other is at Lake Pearl in Wrentham, Mass.

The following riders and their mounts are presented from left to right: Whitaker, Kemp, Cotton and Weeman, M-M; McCambridge, Padel-

Providence Club Activities.

Winter activities of the Providence Motorcycle Club, Providence, R. I., are furnishing much entertainment to the members and friends this season and the handsome club rooms are weekly the scene of entertainment of some kind. A pool tournament for members only has just been concluded and the rivalry was keen. Upon the conclusion of this a whist tournament was inaugurated and is now in progress. New Year's Eve an open house was the feature, and Jan. 3 the nominating committee reported its nominations for the annual election to be held Jan. 17.

New Freight Rate Determined.

A decision of far reaching importance to motorcycle manufacturers has been made by the Interstate Commerce Commission compelling all railroads west of the Mississippi river to ship motorcycles at the same rate as bicycles. The decision not only compels the railroads to give better rates in future, but also makes it compulsory for them to refund all freight charges of the past two years in excess of the rate on bicycles. Manufacturers and dealers who wish to benefit by the decision must file with the commission a list of shipments upon which they claim to have been overcharged. This decision has no connection with the case of the Motorcycle Manufacturers' Association for lower rates recently brought before the Interstate Commerce Commission, although it is thought it may be a forerunner of the outcome of those cases now pending. The latest

decision of the commission was in the Petmacky Company of Austin, Tex., against the Missouri, Kansas & Texas and other railroads, and W. A.

W. L. Hayes of Finch & Hayes, Hartford, Conn., Agent for Flying Merkel.

Griffing of Spokane, Wash., against the Chicago & Northwestern Railway Company and others. They were pending two years.

The Self-Starting Merkel.

One of the features which will attract special attention at the New York show will be the new self-starting Flying Merkel, made by the Miami Cycle & Manufacturing Company, Middletown, O. This machine has awakened considerable interest because of the fact that it was the first self-starting model announced, and because the company has offered a prize of $100 for the best name.

The starter really is fitted to two models of the Flying Merkel, one being a twin and the other a single. The entire line was described in full in The Automobile Journal for Nov. 25, and inasmuch as several new features of construction are embodied in the design, it is anticipated that the Flying Merkel booth in Grand Central Palace will be of decided interest to show visitors.

Indiana State Officers.

The Indiana state F. A. M. commissioner has appointed the following state officers: Secretary-treasurer, E. P. Whitmer; chairman competition committee, E. G. Baker; chairman press committee, J. E. Merz; chairman legal action committee, Roy Sonneborn; chairman membership committee, Elmer Smith.

International Association Formed.

At the recent show at Olympia, Eng., the International Federation of Motorcyclists was reorganized, the only important countries not having delegates being Germany and Australia, both of whom formerly had strong organizations. Among the countries represented were: Belgium, Denmark, France, Holland, Italy, England, Canada and the United States, the latter two countries represented by Willam H. Wells.

New Excelsiors Arrive.

The accompanying illustration shows Officer William Hall of the Providence police department riding his new Excelsior motorcycle, made by the Excelsior Motor Manufacturing & Supply Company, Chicago, which he secured through Hirah G. Baxter, Rhode Island distributor, who recently received his first consignment of the 1913 models. The new machines have excited much favorable comment from those who have thus far inspected them.

New Registered Repair Shops.

These repair shops have become registered with the Federation of American Motorcyclists: Bicycle Supply Company, 64 West Broadway, Salt Lake City, Utah; Vermont Repair Works, 3570 South Vermont avenue, Los Angeles, Cal.; Shelton Sturges, 108 Court street, New Haven, Conn.; Glenn A. Scott, 307 South Branston street, Marion, Ind.

The Most Powerful Twin Made

Since our 1913 announcement appeared two weeks ago we have received two or three sacks of mail every day—all inquiries from persons who want to know more about

THE FLYING MERKEL

The Only Self-Starting Two-Speed Motorcycle in the World

The 1913 Flying Merkel embodies every feature that could be desired in a motorcycle, and many exclusive features hitherto believed impossible to apply to a two-wheeled vehicle. The wonderful Self-Starter, Two-Speed Free Engine Hub, Hess-Bright full Ball-Bearing Motor, the Original and **Only** successful Spring Frame, low saddle position, Mechanical Valves and many other features.

Exhaustive tests have proved the 1913 Flying Merkel the most powerful motor made. The twin has climbed hills that no other motorcycle ever before has conquered, while the single can romp up tortuous grades that some big twins have difficulty in surmounting.

The 1913 Flying Merkel universally has been acclaimed the sensation of the motorcycle world. Ask the most successful dealer in your town—he represents the Flying Merkel, or write direct to us for 1913 advance catalog.

manufacturers to be the guests of the Cycle Parts & Accessories Association at a luncheon at the Hotel Astor immediately after the business sessions.

M-M Line for 1913.

The American Motor Company, Brockton, Mass., is announcing two new models of the M-M for 1913, an eight horsepower twin and a 4.5 horsepower Four-Fifty single. The former is constructed to withstand severe service, including touring over rough roads and mountainous country, while the latter is designed for those who desire a light, durable, convenient mount and do not have use for the excessive power of the twin. High grade material and workmanship are incorporated in both.

The two machines do not differ materially in general design. The motor has a bore of 3.25 inches and stroke of four, that of the twin having a piston displacement of 66.36 cubic inches and that of the single, 33.18.

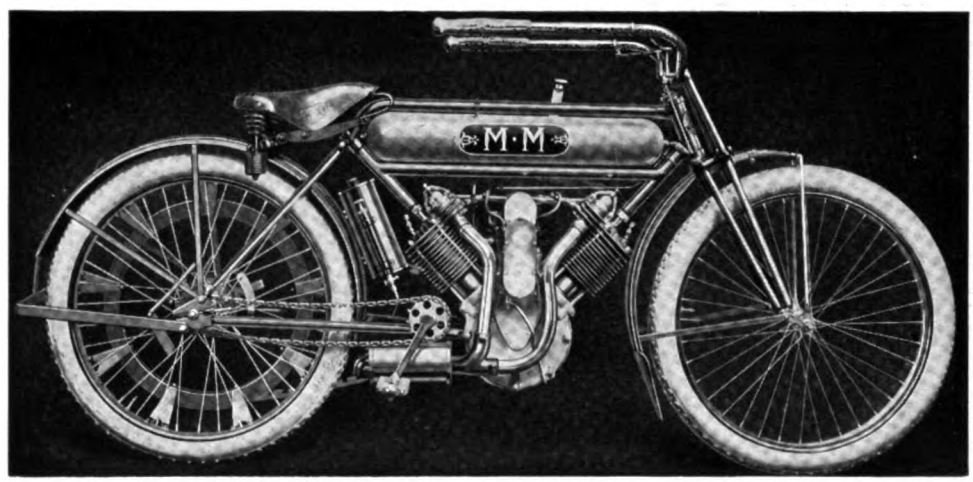
Four-Fifty M-M Single, Rated at 4.5 Horsepower, Presents Changes for Coming Year.

It is maintained by the company that the most vital parts of a motorcycle motor are the cylinder, piston and rings, and special attention has been paid to improving the efficiency and wearing qualities of these parts. The material is a fine grade of gray iron, which is carefully machined, ground and polished, with an idea of securing uniform pressure throughout. The flywheels and shaft are drop forged in one piece. The inlet valve is located directly over the exhaust member. Ignition is by Bosch high-tension magneto, of the latest enclosed type. The carburetor is a special Schebler.

The frame tubes and joints are held to be more liberally reinforced at every point where strain is liable to occur, and heavier gauge tubing has been used wherever the least weakness has become apparent in the past. The lower frame tube, for instance, has two D shaped tubes inserted throughout its entire length. The upper and lower rear frame tubes connecting to the rear jaws are reinforced by a piece of heavy round tubing, this being brazed into the end far enough to support the pressure of the rear brake arms, the idea being that it shall resist any tendency to break or bend. The idler and clutch quadrants are attached to the lower truss frame bar instead of to the tank, as heretofore, a design which is held to make for a firmer construction and to eliminate noise.

The fork construction also has received attention. A very heavy tubing is used for the stem, the wall being nearly .25 inch thick. This special tube is drawn from a high grade of vanadium steel, and the bearing in the fork crown has been increased. A new drop forging is being used for the side plate extensions to the rear axle, and it is maintained that they now have four times the original bearing surface. Each of the four bearings is equipped with an oil cup, insuring proper lubrication.

New spring leaves of silico vanadium spring steel are utilized. The uprights rising from the front axle are of new design, enabling either side to be replaced independently in case of accidental breakage or bending. The fork tip forgings of the lower end of the fork frame have been increased in thickness, with heavier lugs running up into the four fork frame tubes.



The 1913 handlebar is slightly different in shape, being a little wider with grips flaring outward. The bar is keyed to the handlebar clamp with a thick washer around the reinforcement. The grip control parts have been increased in leverage, particularly the exhaust lift grip, in which the resistance of the exhaust valve spring is held to be overcome with less effort than when twisting the grip. All rod ends have been made heavier, giving additional wearing surface at the joints, and lock washers are being used with the nuts on all grip control parts. Ball end rods and

Digitized by Google

ball sockets are larger and stronger than heretofore.

On account of the extra length of the handlebars and the greater weight of the twin, a cross bar reinforcement has been inserted. This also makes for convenience in attaching the Prest-O-Lite tank, lamp, horn, speedometer, watch, etc. A new fitting is used in the centre of the inlet manifold on the twin, this being designed to give a wide sweeping elbow and easy turns and to make for easier access of the gas from the carburetor to the cylinders. The manifold is larger and the size of the carburetor has been increased as well, making for increased power.

With the single, a large tool box is fitted, the capacity being sufficient to carry an extra inner tube and batteries for electric lighting, if desired. A new inlet bonnet clamp also has been fitted to this model, making for easy removal of the inlet dome and carburetor. Features which will be continued without change are the 90-degree principle used on the twin motor, the separate camshaft compartment in the base, the double truss forks, multiple disc free engine clutch, turn buckle chain adjustment, spring tension hand idler, and very long non-grain bronze bearings.

Eight Horsepower M-M Twin, Produced by American Motor Company for 1913 Season.

Indian's Canadian Factory Branch.

The Hendee Manufacturing Company, Springfield, Mass., maker of Indian motorcycles, has made an important step in the invasion of Canada by its establishment of an Indian factory branch at 12-14 Mercer street, Toronto. The Hendee company already had such large business success in Canada that it was necessary to establish the branch to care for it exclusively. The building is of brick, four stories high, and will be devoted entirely to the sale, maintenance and exploitation of Indian motorcycles in Canada. Facilities will be so comprehensive as to warrant the rendering of full service on any Indian model. Edward Buffum as general manager will have charge of the branch.

Another Motorcycle Coming.

The Mooney-Hoye Company, Milwaukee, Wis., is building a new model of motorcycle which will be put on the market later. The new company is located at 522 11th street and the new machine is said to be nearly completed. Mr. Mooney formerly was connected with the Harley-Davidson plant.

New Merkel Agencies.

O. P. T. Daenitz has purchased the motorcycle business of C. W. Brown of Denver, Col., and will continue to represent the Flying Merkel, made by the Miami Cycle & Manufacturing Company, Middletown, O., in Colorado and Wyoming. Mr. Brown will devote himself exclusively to bicycles. The Meredith Motor & Bicycle Company will distribute Merkels in the state of Utah.

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

B. A. SWENSON 298 Blackstone St., Cor. Prairie Ave., Providence, R.I.

1913 F. N. SHAFT-DRIVE MOTORCYCLES.

Lightweight Single, with Two-Speed Gear	$275
Only Machine Built With Handle Bar Control of Clutch.	
Four-Cylinder	$300
With Handle Bar Control of Clutch	$350
Two-Speed Gear, Extra	$50

Equipment includes two brakes, footrests if desired, compound spring fork, combined luggage carrier and stand.

American F. N. Company, Boston, Mass.

Branch—415 Trumbull St., Hartford, Ct.

Digitized by Google

Other agencies recently appointed include: W. A. Duff, Pontiac, Ill.; Spahr Bros., Canal Dover, O.; Falls Garage Company, Chagrin Falls, O.; R. W. Thompson, Tidioute, Penn.; W. B. Apple, Walkerton, Ind.; C. T. Ranere, Hammonton, N. J.; N. E. Linde, Seneca Falls, N. Y.

Club Notes Here and There.

The Motorcycle Club of Wilmington, Del., held its annual meeting recently and elected the following officers: President, E. F. Perkins; secretary, William R. Jacobs; treasurer, A. E. McDaniel.

At a meeting of the Jamestown Motorcycle Club, Jamestown, N. Y., the annual election took place and the following board of directors was chosen: Captain, George Powers; first lieutenant, Walter Chamberlain; racing and touring, Albert Johnson; house committee, Elmer Ostander; publicity committee, Clarence Palmer.

Indian Tricar Utilized in Parcel Post Service in Springfield, Mass.

At the annual election of officers of the New Jersey Motorcycle Club, Newark, N. J., a number of new officials were selected, the list being as follows: President, Roy S. Pascall; vice president, U. Seth Eberhardt; recording secretary, Cyrus H. Benedict; financial secretary, Edward Wilson Allen; treasurer, Henry Sieb; trustee for three years, Howard E. Hill; road captain, Fred Cordes; first lieutenant, Andrew Bohsen; second lieutenant, U. Seth Eberhardt. The officers were installed New Year's Eve with a special programme.

At a recent election of the Century Road Club of America, the following national officers were chosen: President, Emil Leult, West Hoboken, N. J.; first vice president, F. H. Watrous, Chicago; second vice president, E. E. Fraysee, New York City; treasurer, Julius G. Schmidt, New York City; secretary, Fred I. Perrault, Malden, Mass. The following New York State officers were elected: Centurion, Henry C. Sommer, Woodhaven, L. I.; secretary-treasurer, Emil Trunk, Brooklyn.

Indian for Parcel Post.

Postmaster L. C. Hyde of Springfield, Mass., has been utilizing an Indian motorcycle, fitted with tricar attachment, made by the Hendee Manufacturing Company of that city, in the delivery of parcel post since its inauguration, Jan. 1. This machine, which is shown in an accompanying illustration, is one of a number which have been giving good service for some time past in making night collections in various sections of the city.

Milwaukee Maker to Incorporate.

The Milwaukee Motorcycle Company, Milwaukee, Wis., has interested new capital and the company is to be incorporated. New quarters at 834 Muskego avenue have been secured and it is planned to build 200 machines this season. Manager Fuhrman states that the new motorcycle will embody several new and exclusive features.

To Increase Davis Capital.

The Davis Sewing Machine Company, Dayton, O., maker of Dayton motorcycles, has been authorized by its stockholders to issue bonds to cover the construction and equipment of buildings necessary to care for the increasing business of the company. Work will begin early in the spring.

Another Minneapolis Concern.

J. M. Michaelson, designer of the Minneapolis motorcycle, made by the Minneapolis Motor Company, has formed the Michaelson Motor Company at Minneapolis, Minn., with authorized capital of $50,000. Associated with him are his brother, Walter E. Michaelson, and Anton E. Peterson. The new company promises a complete motorcycle line for early spring delivery.

New Racing Circuit Planned.

The Bramley motordrome interests are negotiating to conduct a racing circuit in the principal cities of the East and Middle West next season. T. H. Smith of Cleveland is in charge of the matter as attorney for M. H. Bramley and his associates, which hold franchises for tracks in Kansas City, Indianapolis, Detroit, Minneapolis and Buffalo. If the management of the Riverview motordrome of Chicago can be interested the Bramley syndicate will hold a series of race meets three days a week simultaneously in the eight cities to be selected.

Digitized by Google

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Pontiac Motor Castings Company, Pontiac, Mich.; $8000; to manufacture steel and brass castings; incorporators, William J. Brown, T. E. Lyons, Peter J. Donnelly.

Northwestern Tire Company, Minneapolis, Minn.; $50,000; to deal in tires; incorporators, J. C. Roney, Frank J. Kerner, A. A. Kerner.

Jones Pneumatic Tire Spring Company, Hartford, Conn.; $100,000; incorporators, Lyman D. Jones, Etta E. Brandeau, Clarence R. Hall.

Superior Motor Company, Detroit, Mich.; $100,000; to manufacture and sell combustion engines and accessories; incorporators, Henry Fraser, Walter G. Schmeider, Gaylor C. Brimmer.

The Rutsen Power Company, Cleveland, O.; $100,000; to control patents of and to manufacture the Rutzen motor; incorporators, D. W. Corbin, Francis J. Peck, D. H. Tilden, Alonzo M. Snyder, N. I. Young.

R. M. Allen Motor Sales Company, Cleveland, O.; $10,000; to deal in automobiles and automobile trucks; incorporators, Blanche M. Allen, R. M. Allen, H. W. Wiebush, T. B. Logan, H. C. Kagy.

Foreman Motor & Machine Company, Toronto, Can.; $40,000 to manufacture engines; incorporators, W. J. Brown, G. H. Foreman, T. H. Sharp.

General Oil Manufacturing Company, Jersey City, N. J.; $50,000; to manufacture oil products; incorporators, G. E. Bennett, F. R. Jacobson, W. Perlis.

Premier Agency Company, Indianapolis, Ind.; $30,000; to deal in automobiles; incorporators, T. H. Adams, W. H. Foreman, J. W. Cowper, V. C. Vette, D. E. Sherrick, H. B. Wilson.

WITH THE MANUFACTURERS.

The B. F. Goodrich Company's branch on Boylston street, Boston, Mass., was visited recently by the students of the Boston Y. M. C. A. Automobile School. This was the second tour of inspection of plants in that city in connection with the course of study outlined by the association. The large stock of Goodrich tires and the methods used in the different departments were fully explained by several guides from the Goodrich staff, and much valuable information was gained concerning the care and repair of pneumatic tires. Of special interest was the demonstration of the necessary work in fitting motor truck wheels with solid rubber demountable equipment.

The Cartercar Company, Pontiac, Mich., maker of the Cartercar line, has found it necessary to open a factory branch at 242-244 Peachtree street, Atlanta, Ga., to look after its rapidly growing business in the South. W. C. Mahoney, who has been the special representative of the company in this district for some time has been appointed manager.

The Buick Motor Company, Flint, Mich., maker of Buick machines, at a recent meeting elected the following officers for the coming year: President, C. W. Nash, Flint; vice president, Thomas Neal, Detroit; treasurer, James T. Shaw, Detroit; secretary, Standish Backus, Detroit; assistant secretary and treasurer, F. A. Allen, Flint; comptroller, L. F. Ohland, Flint.

The Peerless Motor Car Company, Cleveland, O., maker of Peerless trucks and pleasure cars, has been authorized by its stockholdrs to increase its capital from $3,000,000 to $10,000,000. Present holders will get a 40 per cent. stock dividend and may exchange half of their enlarged holdings for an equal amount of preferred stock.

W. H. Barger, a pioneer automobile dealer in Cleveland, O., has been secured by the Thomas B. Jeffery Company, Kenosha, Wis., maker of Rambler Cross Country cars, as exclusive representative for this line in Cleveland and northwestern Ohio.

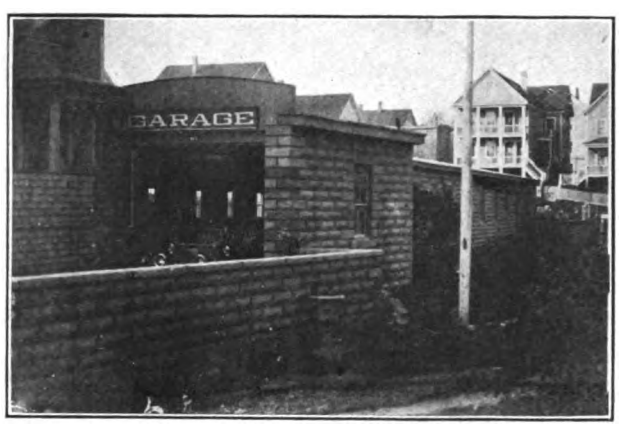
The Motz Tire & Rubber Company, maker of Motz tires, has just established a factory branch at 4436 Olive street, St. Louis, Mo., equipped to give service to all users of Motz tires and to care for Motz distribution in the St. Louis field. E. G. Seibel has been appointed manager.

Charles Y. Knight, inventor of the sliding sleeve valve motor, is now in New York to attend the automobile

Boston Y. M. C. A. Students on a Recent Tour of Inspection of the Local Branch of the B. F. Goodrich Company.

Digitized by Google

shows. He came to this country direct from his home at Coventry, Eng., and will remain here until after the Chicago shows in February.



The King Motor Car Company, Detroit, maker of King cars, has announced the appointment of Ray B. Warman as export sales manager. Mr. Warman was export manager of the Scripps Motor Company and since taking that position has increased that company's export business to 52 per cent. of the total sales.

The Buick Motor Company, Flint, Mich., maker of Buick machines, is erecting a building at Peachtree and Harris streets, Atlanta, Ga., which is said to be one of the largest buildings of its kind in the world. It has 26,000 square feet. One entire floor will be given over to a complete stock of parts and another will comprise the service department. R. H. Losey is manager.

The Pope Manufacturing Company, Hartford, Conn., maker of Pope-Hartford machines, has voted to incorporate under the laws of Massachusetts. Stockholders will be offered the privilege of exchanging their Connecticut stock for shares of the Massachusetts corporation on a share-for-share basis.

GARAGE AND DEALER.

Horton's Garage, Fall River, Mass., is headquarters for that city and vicinity for the K-R-I-T cars, made by the K-R-I-T Motor Car Company, Detroit, and the Crow Elkhart line, produced by the Crow Motor Car Company, Elkhart, Ind. The main garage is 80 by 27 feet, and it

Horton's Garage, Fall River, Mass., Headquarters for K-R-I-T and Crow Elkhart Models.

and the repair shop in the rear are of concrete construction and well lighted throughout. Two entrances, one at the front and the other at the rear, make the building particularly easy of access. H. A. Horton is manager, and aside from the cars represented, a full line of accessories and supplies is carried.

The Campell-Collins Company, San Jose, Cal., has opened a new automobile supply house at 241 South First street.

The Kendall Auto Company, Pasadena, Cal., has opened a new garage and salesroom on Broadway. The company is distributor for the Regal, Firestone-Columbus and Columbus electric lines.

Charles Day has taken over the garage on West Union street, Athens, O., and plans to make extensive additions to the present building.

The Buick Motor Car Company, Admiral boulevard, Kansas City, Mo., is to erect a large addition to its plant at an expenditure of $20,000.

Frank Waterhouse & Co., Inc., Seattle, Wash., has erected a large building at 1512 Broadway, which will be the headquarters in the Northwest for the Garford trucks and pleasure cars, made by the Garford Company, Elyria, O. P. E. Sands, for the past four years manager of the Seattle branch of the Studebaker Corporation, is in charge.

Charles H. Thompson, Los Angeles, Cal., has moved to his new garage on South Olive street, where he has facilities to extend the scope of his business.

Oliver Onsgard has retired from the firm of Onsgard & Foss, Caledonia, Minn., dealer in Ford cars, made by the Ford Motor Company, Detroit, and the business will be continued by his former partner, Edward Foss.

The W. L. Nolan Company, Rochester, Minn., has taken possession of the garage of W. H. Brown and the building will be entirely remodelled.

George Middleton and C. C. Wilson have formed a partnership and have purchased the Algona Auto Garage at Emmetsburg, Ia., which they will conduct on an enlarged scale.

The Buckeye Garage has been opened on Monument avenue, Hamilton, O. John Leever will conduct a general motor car repair and supply shop business.

John Wenick, who owns the Mt. Diablo garage building on McDonald avenue, Richmond, Cal., is erecting an addition to the establishment, which is conducted by the Mt. Diablo Garage Company, Inc.

The Manley Hardware Company, Harvard, Wis., has had plans made for the erection of a substantial addition to its garage.

Jeremiah Coughlin & Son, Fort Dodge, Ia., has leased the Newberry livery stable, which will be converted into a modern garage.

The Hanover Garage, of which Andrew D. Baird is manager, is occupying its new, modern quarters, recently completed, at 20 Keap street, Brooklyn, N. Y.

Huestis & Knoche, Montgomery, N. Y., is establishing the Montgomery Garage & Machine Works and the Bull building is being remodelled for this purpose.

Daniel R. Schnabel, Johnstown, Penn., is to open a new automobile salesroom and repair shop on Main street, to be of modern construction.

Blackman & Follansbee, East Whitman, Mass., has built an addition to its garage to care for increasing business.

J. L. Bell and Ralph Wilson, Salt Lake City, Utah, have opened a garage on State street.

A. A. True and N. Levering, Highland, Cal., have purchased the Highland garage and will install a modern machine shop.

E. L. Clauss & Son has established a new fireproof garage at 6450 Selma avenue, Hollywood, Cal. It will be known as the Baker garage.

Arthur A. Bond has sold his interest in the Glasgow garage, Glasgow, Mo., to his partner, Charles J. Himmelberg, who in turn has disposed of a half interest to M. R. Cochran. The company will occupy space in the Fuller building.

Edward Dobschuts has moved into his new garage, the Eddie Motor Works, Pasadena, Cal., at Fair Oaks avenue and Center street.

L. C. Dale and O. G. Baker are occupying their recently completed garage on Stanton avenue, near Pacific electric station,, Stanton Cal.

Mrs. L. M. John, Inglewood, Cal., has purchased the rights, title and interest in the Inglewood garage of T. J. Myers and T. G. Stevens.

Laven & Halstrom, Mankato, Minn., has taken possession of its new repair shop and garage at 126 Washington street.

John Thompson of the Avon garage, Asbury Park, N. J., has taken a long lease of the McCabe building, Lake avenue, and opened a salesroom for the automobiles for which he is agent in that territory.

Taft's Queen's Plaza Auto Supply, Long Island City, L. I., in addition to its present location will establish other quarters at 65 Prospect street, for an annex garage. All modern appliances will be installed in the building. In addition to handling the Ford and Buick cars, the company carries a full line of tires, greases, oils and supplies.

The Turnbull Auto Company, Willimantic, Conn., has purchased property on Chestnut street and will remodel the building for a modern garage and general repair shop, with F. J. Wood in charge.

Otto J. Heimann of Chicago is planning to erect a 1.5 story garage on North Robey street, that city.

The Hartford Motor Car Company, Riverside, Cal., will establish a garage at Eighth and Hemon streets. The company handles the Buick cars, made by the Buick Motor Company, Flint, Mich., and a complete line of accessories. E. K. Hartford of San Diego, Cal., is manager.

O. B. Jones, San Bernardino, Cal., has purchased the interest of Dr. H. W. Hall in the garage business of Heintz & Hall on F street and the business will be continued on a larger scale by Heintz & Jones.

Digitized by Google

CO-OPERATION NEEDED IN ROAD BUILDING.

AMONG the speakers at the recent third American road congress in Cincinnati, O., was Raymond Beck, chief of the touring bureau of the B. F. Goodrich Company, Akron, O. Mr. Beck made a strong plea for co-operation in road construction, and since the Goodrich company has been busy for some time in routing the country, posting signs for tourists, etc., his suggestions will prove of interest. He said in part:

"While this congress is devoted to the technique of road construction, maintenance and efficiency of engineering service, we have lost sight of a very prime factor for preliminary consideration, or in planning road building, and that is, interstate travel and interstate co-operation by state officials, and this possibly might also refer to intercounty co-operation by county officials. You are building your small veins of travel first and not your arteries of travel. We criticise the individual efforts sometimes made by counties and the individual efforts sometimes made by states that do not consider the advantageous connections with some large centre or centres of the adjacent county or the adjacent state. Large centres automatically demand good highway connections, but they are not always getting it.

"I might cite, as examples, such connections as from Toledo to Detroit, from Chicago to St. Louis, from Cincinnati to Lexington, from Cincinnati to Louisville, from Pittsburg to Columbus, from Pittsburg to Cleveland, from Buffalo to Erie and Cleveland, from Washington, D. C., to Richmond, from Portland to San Francisco. Practically every large city has connections that should be improved for interstate travel for use during 12 months in the year and for wet weather as well as dry. Can't you conceive, gentlemen, the advantage to the individual state or county that these connections would make if coupled with good hard roads? You can see these arteries of travel automatically creating smaller veins and filling them with the good red corpuscles of civilization from the cities, and is this not better than working in circles or squares as individual units?

"Several years ago I began the preparation of a large map of continental Europe, worked out on kilometer scale and showing in diagrammatic form all the best improved roads in Europe. I first plotted the old roads that were still in excellent condition and as soon as they were incorporated on the map I could see the whole scope or idea of practically every country in Europe. There they had worked out their main arteries of travel first, to connect not only the large cities in the individual country, but they evidently got together and planned to connect the large international centres.

"I then added to this map the newly improved roads up to 1909, and I wish I had that map here to show you now. I know that from an engineering standpoint you would readily appreciate that European roads were planned absolutely for the best good as a whole and that their planning was not confined to the local unit system, but that the local unit system was far greater benefited by opening up the large centres of population (national and international) so that they could reach the country and the country reach the city and city reach city, and the basis or foundation of all their good roads was the trunk line highways first.

"My argument is that we should not only follow in the footsteps of New York, Massachusetts, Connecticut and other eastern states who have planned trunk line state routes or highways, but that the state highway commissions and state highway engineers should get together and co-operate for the purpose of improving interstate highways as well.

"The B. F. Goodrich Company will do its part in stimulating road improvement. It has already spent nearly $1,000,000 on sign posting the main or popular touring routes and issuing road guide books and it proposes to continue this work all over the United States."

BRIDGEPORT'S ANNUAL SHOW.

Entire Space Already Allotted to Members of the Automobile Dealers' Association.

The annual automobile and motor boat show to be held March 3-8 at Bridgeport, Conn., will this year be one of the largest held in that state. The event will be staged in the Park City rink, which will furnish about 130,000 square feet of floor space.

At the first meeting of the Bridgeport Automobile Dealers' Association, under whose auspices the display will be held, the entire allotment was made, so anxious were the various exhibitors to secure space before it should be too late. B. B. Steiber is the active manager of the show.

STUTZ

You Should Know More About The Stutz

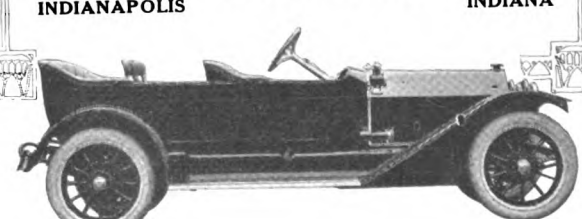
You should go into the vital parts of the STUTZ car and get the facts—be convinced.

Any manufacturer can build a beautifully finished and luxuriously equipped car—but the **real worth** of a car comes in the construction.

The STUTZ is made right from the radiator to the rear axle. Every ounce of material—every detail of workmanship that goes into every STUTZ car is absolutely the best. That is one of the reasons why the upkeep cost of the STUTZ is the lowest. Every mechanical principle of the STUTZ is positively correct.

The STUTZ has a powerful motor that will pick up on any road or hill at the touch of the throttle. It has attained a record second to none for consistent performance.

Every STUTZ is exceedingly easy-riding and comfortable.



The straight line low slung body, deep upholstery and luxurious appointments of the STUTZ give it that aristocratic design that lends dignity and quality to a high class motor car.

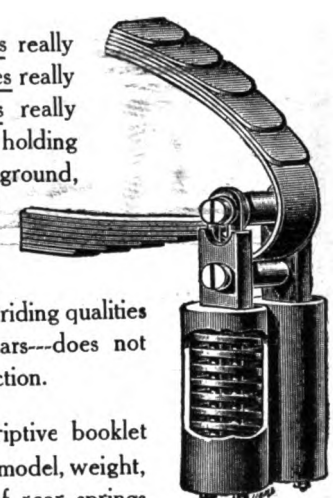
ALMOST UNIVERSALLY USED IN FRANCE — SHOCK ABSORBER — THE RAGE IN ENGLAND

50,000 sets sold in Europe alone

in two years after the J. M. made its debut!

United States girdled in one year—

you see the J. M. on high grade cars the country over.



Why?

Because the

J. M. Shock Absorber

has been silently advertised everywhere---by the best advertisement any article can have---personal endorsement of satisfied users.

Because the J. M. does really make riding a comfort; does really reduce tire expense; does really minimize engine wear---by holding the rear wheels on the ground, despite rocks, ruts, and "thank-ye-ma'ams."

The *Ford J. M.* makes a Ford the equal in riding qualities of much higher-priced cars---does not arrest or lock the spring action.

Send for our new descriptive booklet "D," and state the make, model, weight, type of body and width of rear springs of your car---so that we may suggest the type of J. M. that is perfectly fitted to your needs.

See the J. M. at the Madison Square Garden Show.
Basement space 658.

MILWAUKEE AUTO SPECIALTY COMPANY
128 Second St., Milwaukee, Wis.

Add $10 to $20 Profit to Each Automobile Sale

Here's an easy way to pick up an extra Ten or Twenty Dollar Bill whenever you sell an automobile.

Just send us the name of the purchaser and we will endeavor to sell him an Edwards Private Portable Steel Garage. That's all we want you to do—*merely furnish us the name.*

You Invest No Money or Time

It means $9.25 to $20 profit *FOR YOU* on each sale. And you've no *money* or *time* invested. Send us a list of *all* automobile owners in your locality, and on this plan you'll make a nice, clean profit—perhaps several hundred dollars.

The Edwards is far and away the most popular and widely advertised Private Garage. Our prices are much lower than others'. And we've an excellent system of following up all names received. We won't miss any opportunities to close sales.

Write Us Now Send us your list of local auto owners at once, or we will be glad to answer any questions.

EDWARDS FIRE-PROOF GARAGE

An artistic, fire-proof steel structure for private use. Gives absolute protection from sneak thieves, joy riders, fire, lightning, accidents, carelessness, etc. Saves time, work, worry and trouble. Comes ready to set up. All parts cut and fitted. Simple, complete directions furnished. Absolutely rust-proof. Joints and seams permanently tight. Practically indestructible. Locks securely. Ample room for largest car and all equipment. Made by one of the largest makers of portable fire-proof buildings. Prompt, safe delivery and satisfaction guaranteed.

The Edwards Manufacturing Co., 714-764 Eggleston Ave., Cincinnati, Ohio

or

MONEY BACK IN 30 DAYS

No ifs, ands or buts. Money back if you're not satisfied.

The Planhard Carburetor will save you 10% to 25% gasoline. That statement is straight from the shoulder. It may sound big, but it is so.

If Your Car Is Over Two Years Old

you haven't even a chance for an argument. Why? Because the Planhard takes advantage of a natural law heretofore neglected, and we own the only method of applying the principle. Price, three-quarter-inch, $9.00, etc.

Send For Your Chart and Book

We have prepared charts (one for automobiles, one for boats,) which show the dollars saved in a given time on basis of 20c gasoline. You can locate the spot at which the Planhard will have paid for itself and thereafter pay you a cash return. There is a copy for you, simply awaiting receipt of your address, free. Send for it.

The Flexibility and Control

amazes new users. Makes new engines of old ones.

Absolutely automatic. No working parts. No springs, valves or cams. Permanent adjustment. Gives increased power and speed with any gas in any weather or altitude.

Twenty miles to the gallon is not an unusual Planhard average.

Takes Heavy Gas

now generally supplied as well as light. It is the extreme of efficiency in every way for big and little cars and boats.

4300 Miles Without a Miss.

G. A. Schmidt, Lawrence, Mass., "gets over 20 miles to a gallon on his car."

Geo. O. Grosvenor—"Right mixture at all times."

C. H. Retcher—"Worth its weight in gold."

Send for your chart and book.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. **TRY THEM NOW.**

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing ***noise*** and friction to a minimum. A trial will convince the most skeptical that **"Invader"** Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

CHAS. F. KELLOM & CO., 113 Arch Street, Philadelphia; Branch: 719 N. Broad Street

NEW ENGLAND BRANCH, 284 Columbus Ave., BOSTON, MASS.

Prime Your Motor

If you have "ALL-IN-ONE" Spark Plugs you can quickly prime your motor and easily start it on the very coldest morning. Easy priming is only one of the advantages given by the "ALL-IN-ONE" Petcock. Open the petcock while the motor is running and all soot will be blown off the sparking points—a true *self-cleaning plug.* Open the petcocks when the motor is missing and you'll quickly detect which cylinder is giving trouble—a *real trouble finder.* Open the petcock and inject a little Kerosene—this is the *best carbon remover* ever tried.

"ALL-IN-ONE" has the best feature of other plugs and the Petcock besides.

Price $1.50 each.

We shall prosecute vigorously all infringements now on the market or any which may spring up in the future.

BOSCH

Predominates—Of Course

THERE were 93 makers of cars exhibiting at the New York Shows and the following list of their products on which Bosch Magnetos were fitted is

Convincing Bosch Argument

Winton	Alco	Fiat
Mitchell	Mercer	Kline
Locomobile	S. G. V.	Hupp
Peerless	Cunningham	Henderson
Stevens-Duryea	Knox	Metz
Stoddard-Dayton	Moon	Case
Pope-Hartford	Matheson	Pathfinder
Franklin	Selden	Detroiter
Lozier	National	Minerva
Overland	R. C. H.	De Dion Bouton
Pierce-Arrow	Bergdoll	Lancia
Packard	American	Renault
Marmon	Speedwell	Mercedes
Garford	Paige	Daimler
Columbia	K-R-I-T	Isotta
Moline	Inter-State	Metallurgique
Pullman	Velie	Panhard

NO argument, no proof, no claim, is so thoroughly convincing as is the showing of universal selection—the greatest engineers of the industry acknowledge the superiority of Bosch—the extensive adoption of this method of ignition is the zenith of supremacy proof.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ **ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.**

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3⅛ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
	3⅛-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3⅛-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

You want the Best? Ask your DEALER for the "CHELSEA"

Our Exclusive Feature

We will (at small extra cost) furnish our Regular Models with the

AUSTIN

Two-Speed Axle

This axle provides two different gear ratios, both on direct drive, and in combination with a three-speed transmission gives six speeds forward and two reverse.

Model "77" has a Regular Direct Drive of 3 1-2 to 1, and a Special Direct Drive of 2 to 1.
Model "55" has a Regular Direct Drive of 4 1-2 to 1, and a Special Direct Drive of 3 to 1.

The Regular Direct Drive provides ample power and exceptional ease of control for hills, bad roads and crowded city traffic.

The Special Direct Drive for normal conditions, shows a gain of over 50% in mileage for the same fuel consumption and motor speed, eliminates the noise, wear and tear of running the motor at excessive speeds, adds materially to the life and durability of the car and pleasure of riding.

Model "77" Six Cylinders, 4 1-2 x 7 - - $6000.00
Model "66" Six Cylinders, 4 1-2 x 5 1-2 - $5000.00
Model "55" Six Cylinders, 4 x 5 - - - $4000.00

MORE NEW, IMPROVED and **DISTINCTIVE FEATURES** than any other car. Two-speed rear axle, high pressure air self-starting system, complete electric lighting system, left hand steer, center control, two-spark magneto, four-speed transmission, both brakes controlled by foot pedals, and our special nine passenger body.

Write for complete description and any information you may desire in regard to our two-speed axle.

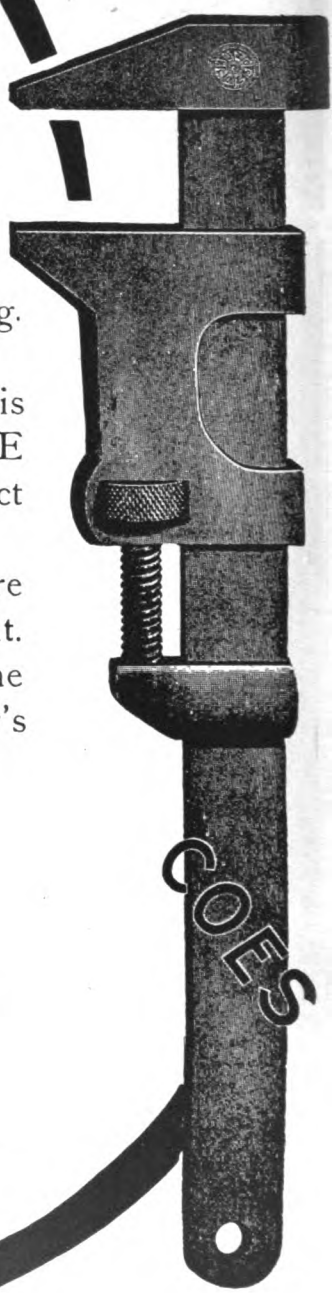
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

EMPIRE

"The Little Aristocrat"

Model 31, 108" Wheel Base, 5 passenger

Completely Equipped $950

Demountable Rims	Double Tire Irons	Oil Sight Feeds	Shock Bumpers
Mohair Top	Windshield	Prest-O-Lite Tank	Speedometer
Top Envelope	Robe and Foot Rail	Head, Side and	Jack and Tool Kit
Storm Curtains	Over Size Tires	Tail Lamps	Eisemann Magneto

The light weight of the Empire, its efficient and sturdy design and build, are the secrets of its maintenance economy. This is one of the reasons that fully seventy-five per cent. of the cars we sell are bought by motoring experts, who have owned other cars and who appreciate almost at sight the wonderful merit and value of this five passenger touring car.

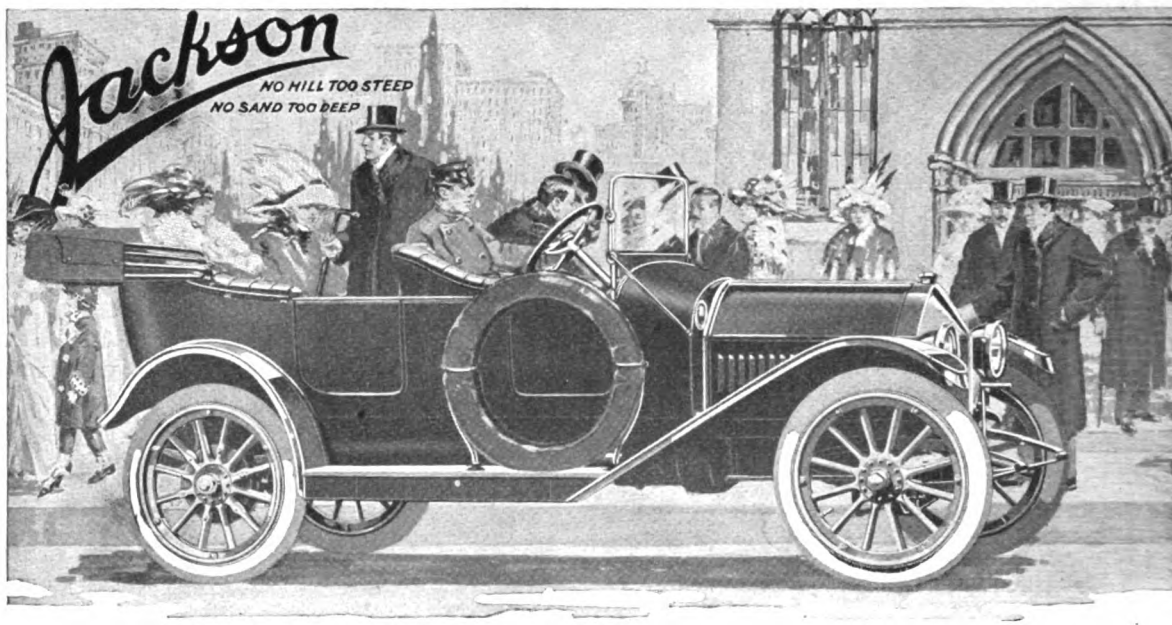
It is the premier automobile tire of the world

Our Dunlop Sales have increased 600% within the past year's time and the coming year is destined to show an even greater growth.



Motorists have come to realize what tire experts have long known, that the genuine Dunlop Straight Side is in many respects the ideal type of motor car tire.

The dealer who stocks Dunlop Tires now and pushes them vigorously among his trade will get the full benefit of this tremendous increase in business.

But bear this in mind—the Genuine Dunlop Tire—the tire that has shown this tremendous increase in popular demand—the only tire that possesses all the merits of this type, was originated and is now made exclusively by the

Jackson "Majestic," $1,975.

Forty-five horse power, unit power plant; four cylinder, long stroke motor, 4½x5½ inches; 124-inch wheel base; 36x4 inch tires. Full elliptic springs, front and rear. Deep, roomy body, with 10-inch upholstery. Electric starting and lighting system, dynamo and storage battery. Equipment of mohair top, top hood, ventilating wind shield, speedometer, oil and gasoline gauges on dash, Firestone universal quick detachable rims, extra rim, tire carrier, electric horn, robe rail, foot rest, pump, tire outfit and tools. Black and nickel trimmings.

Jackson dealers are enthusiastic; that's the story of the new Jacksons

When the first of the new Jacksons was announced, a wave of enthusiasm swept the country. Inquiries literally poured in.

That's how the buying public received the Jackson; and the same result followed the announcement of the other models.

What did the dealers do?

To a man they saw the great possibilities presented by the Jackson line.

Every one of them came in with requests—no, they were demands—for increased allotments.

"Sell?" they said, "you are giving us the best selling line of Jacksons you ever built!"

That's what they said when they were told about the cars.

Their enthusiasm was increased a hundred-fold when we outlined the most extensive advertising campaign the Jackson Company has ever attempted.

This advertising includes not only double pages and single pages in publications like the Saturday Evening Post, Collier's, Literary Digest, Life, etc., but local newspaper advertising—continuous and consistent through the big selling seasons.

Is it any wonder that Jackson dealers are on tip-toe?

They have a line of cars they can sell in competition with anything on the market—on any basis whatever.

They are sure of themselves; sure of their cars; sure of factory co-operation through a big advertising campaign.

Jackson "Sultanic," $2,650.

Seven passenger, six cylinder, 55 horse power, unit power plant; long stroke motor —4¼x4¾ inches; 138-inch wheel base; 36x4½ inch tires. Full elliptic springs, front and rear. Deep, roomy body, with 10-inch upholstery. Gasoline tank under dash supplied from storage tank at rear, with pressure pump. Total capacity, 20 gallons. Electric starter, electric dynamo and lighting system, mohair top, top hood, ventilating wind shield, speedometer, oil and gasoline gauges on dash, demountable wheels, extra wheel, wheel carrier, robe rail, foot rest, pump, jack, tire outfit and tools. Trimmings black and nickel. Five passenger, $2500.

Their feet are on solid ground; they are in position to put ginger into their work and they are doing it.

If your instinct for business tells you that you want to be with the Jackson, say so to us and without delay.

The sooner you act, the better your chance if your territory is now without Jackson representation.

Jackson "Olympic," $1,500

Thirty-five horse power, unit power plant; four cylinder, long stroke motor—4⅛x4¾ inches. 115-inch wheel base; 34x4 inch tires. Full elliptic springs, front and rear. Deep, roomy body, with 10-inch upholstery. Gasoline tank under dash, supplied from storage tank at the rear, with pressure pump. Total capacity, 20 gallons. Equipment includes Disco Self-starter, mohair top, top hood, ventilating wind shield, speedometer, oil and gasoline gauges on dash; Prest-O-Lite tank, with automatic electric lighter; Firestone universal quick detachable demountable rims, extra rim, tire carrier, robe rail, foot rest, pump, jack, tire outfit and tools. Trimmings black and nickel.

The New Cartercars Are Even Better!

In the new Cartercar Models Shown here you will find all the good features of the previous Cartercars with a few improvements and the very latest ideas in body designing. We are certain that, when you ride in any of these, your verdict will be "A Very Good Car."

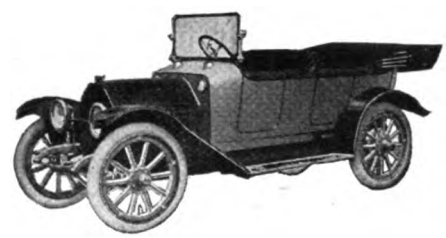
New Electric Starting and Lighting System

Just press down a small knob and the engine is cranked—turn the same knob and you light all or as many of the lamps as you wish. Simple, isn't it?—yet it is always reliable. We have tried this system out under all conditions and it has proven 100% efficient.

Friction Transmission the Same

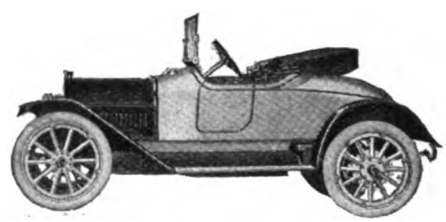
We didn't even try to improve the Friction Transmission. This feature is largely responsible for the great popularity which the Cartercar is enjoying today. You have still the unlimited speeds—the one lever control—and all Cartercars will still climb 50% hills as easily as ever.

Save 1-3 to 1-2 of Your Tire Bills



Jerks and jars are eliminated by the Cartercar Friction Transmission. You can easily see how this means a much greater mileage from your tires. Many owners say that they have secured about twice the ordinary wear. Of course, this smooth running means less upkeep expense for all parts.

The Service You Want



You don't have to consider whether the roads are good—or the weather satisfactory. Your Cartercar will travel up hills and through mud and sand. The Friction Transmission is the strongest and most efficient feature of the Cartercar.

At the Shows

We will exhibit at all the big winter shows and will be pleased to meet you there. Let us send you our catalogue now.

Ever Try to Stop Your Car

And The Brakes Refused To Hold?

It's not a pleasant experience—especially in an emergency. Nothing is so ALL important as efficient BRAKE LINING —lining that will "grip" with slightest pressure.

Line Your Brakes With

TRADE MARK
Raybestos
REG. U.S. PAT. OFF.

"THE ORIGINAL AND BEST ASBESTOS BRAKE LINING"

RAYBESTOS gives remarkable service. It adds to the effectiveness of any brake. It does the trick **instantly,** any time, every time. RAYBESTOS is, without doubt or question, superior to any other lining, because it is made of GENUINE asbestos, specially woven, tightly woven, evenly woven. It is treated by a process which is known **only** to the manufacturers of RAYBESTOS —a process which insures long life and wear. It gives an element of security, a factor of safety unobtainable in ordinary, "cheap" brake linings.

WARNING!

Many inferior imitations are sold to motorists as RAYBESTOS. The popularity of RAYBESTOS—the demand for it has led a few dealers to palm off the substitute as the GENUINE. We stamp the name RAYBESTOS in every foot of the lining for the sole purpose of protecting the purchaser. See that it is there—when you buy RAYBESTOS.

Be Sure To See The Royal Equipment Co. Exhibit at the Show.

Overland

$985
F. O. B. Toledo
Completely Equipped

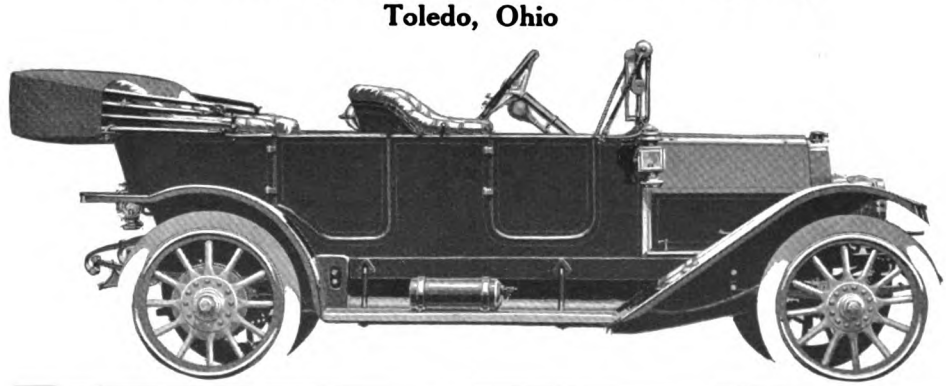
High-priced feature No. 12

The springs on the Overland Model 69T equal those on $1200 cars. They are of the highest grade, heat treated spring steel.

The front springs are semi-elliptic, 36 inches long and 1 3-4 inches wide.

The rear springs are three-quarter elliptic, 42 inches long and 1 3-4 inches wide---with scroll ends.

Model 69T springs each possess six sturdy leaves with steel bushing eyes. The shackles are drop forgings; they are fitted with case-hardened bolts, working in special anti-friction bushings. The spring seats in the rear axle are left free to oscillate on their saddles, insuring great riding comfort.



Model 69T springs must finally endure a vibration test on a special testing machine with a capacity of 6,000 lbs.

We repeat again: $1200 cars have no better springs than the Overland for $985.

Car illustrated—5-passenger "Six" Touring—$2850. Fully equipped.

135-inch wheelbase, 36x4½ tires, Electric Starter and Electric Lighting, Independent Bosch Dual Ignition.

See the real motor car sensation of the century

THE NEW SPEEDWELL "SIX" with ROTARY VALVE MOTOR

The biggest innovation in the history of the motor industry makes its appearance at the Chicago Pleasure Car Show in this big superbly appointed Speedwell "Six" equipped with the Speedwell Rotary Valve Motor.

Allowing due deference to public opinion we are offering in conjunction with the Speedwell Rotary Valve Motor, a standard high powered six-cylinder poppet valve motor in our standard Speedwell chassis.

The buyer has an option of selecting either poppet or rotary valve motors on any Speedwell "Six" model at exactly the same price.

The Speedwell Rotary Valve Motor.

The primary advantages of this motor are silence, simplicity, freedom from wear, and lack of vibration.

Between 200 and 300 less parts than are required for the prevailing types of six-cylinder poppet valve motors.

No reciprocating parts in valve construction.

Valves revolve at one quarter of crank shaft speed.

Valves cannot get out of time—once set always the same.

No valves to grind and practically no wear—valves that have been driven **100,000** miles show full efficiency.

Power developed is in excess of other motors of equal piston displacement.

A really marvellous motor—simple in the extreme.

We can't convey any adequate idea of this motor's value in cold type—**see it at the show—send for literature.**

OUR EXHIBIT

at the Chicago Automobile Show, Feb. 1st to 8th, includes a Poppet Valve "Six" Chassis, a Speedwell Rotary Valve "Six" Chassis and complete cars.

4 and 5 Passenger Models $2850—Fully Equipped.
7 Passenger Model $2950—Fully Equipped.

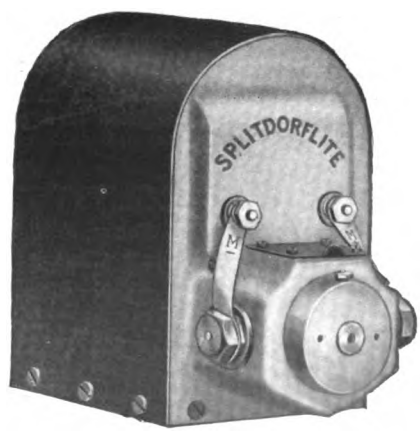
SPLITDORF

"Always There"

The non-vibrating "T S" SPLITDORF COIL—the latest and most *finished* of all types of coils, is notable in that it is equally effective with all the newer, as well as older models of the famous SPLITDORF low tension system.

Its neat appearance on the dashboard, with kick switch, ignition button for battery connection and lock and key for the whole operation, is only in keeping with its real effectiveness and durability.



Enclosed in a light waterproof case extending through the dashboard, it has an electrical construction that makes its firing qualities with any engine unsurpassed by any other coil. The coil proper being mounted on the base of of the switch, the connecting leads from the switch contacts to the coil are very short while the terminal wires from the coil and battery and magneto leads are brought together in a neat and compact installation.

The SPLITDORFLITE electric lighting generator is the smallest, most compact and only self-contained generator on the market. It specially lends itself to installment on machines not designed for a lighting outfit and can be installed on any make of engine of almost any model.

A positive source of illumination, spotlessly clean, unaffected by weather conditions, the SPLITDORFLITE once properly installed ends an owner's lighting troubles for all time.

SPLITDORF IGNITION devices including MAGNETOS, PLUGS, COILS, as a matter of fact, should be specified with every form of hydro-carbon motor. We will gladly shoulder all responsibility for any change over to our superior system and guarantee the greatest satisfaction.

If interested in any form of ignition for gasoline motors, just write in for our free literature. Our new catalog, our "Racing Record," or our "New Lights for Old" is yours for the asking. Do it TO-DAY.

MERCER

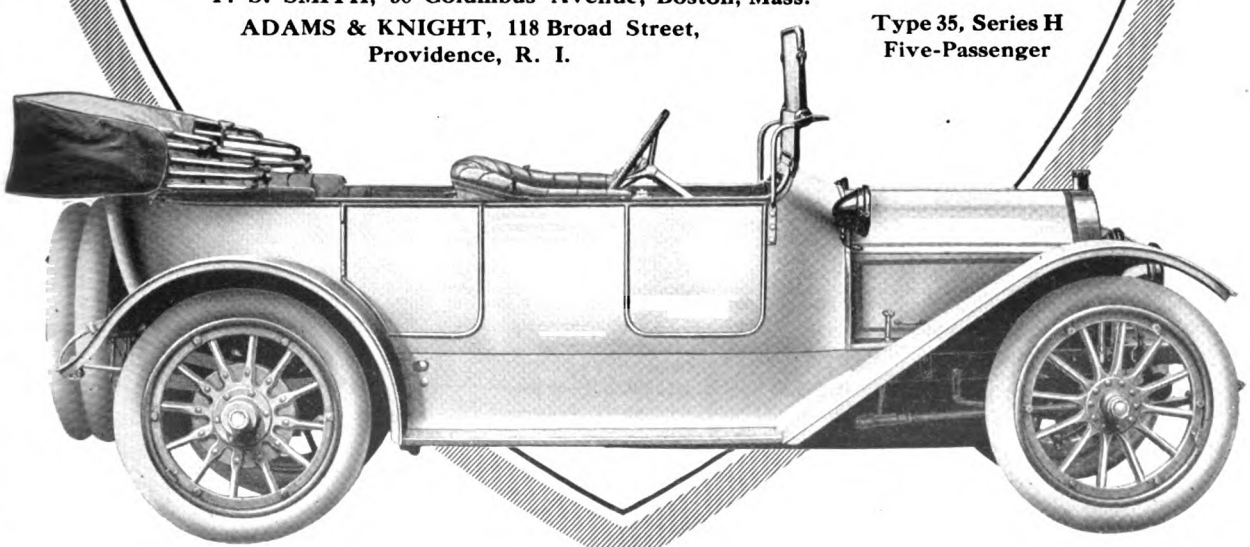
ANNOUNCING

Type 35, Series G, Four-Passenger
Type 35, Series H, Five-Passenger
Type 35, Series J, Raceabout
Type 35, Series K, Runabout

A NEW series of Mercer cars that appeal directly to the Motorist who realizes that bulk and weight are no longer essential in a motor car of the highest type. The Mercer is the "happy medium" car — neither too heavy nor too light.

Power, strength, durability, consistency of performance, comfortable riding qualities, graceful appearance, up-to-the-minute appointments, and real legitimate dollars-and-cents value, are what influence wise buyers in their choice of a car. Measured by this standard the Mercer is recognized as leader of the medium-weight class.

Pronounced features are high efficiency motor, perfect lubricating system, reliable steering gear, large and perfectly balanced crank shaft, four-speed transmission, foot brake operating on transmission, springs that give real riding comfort, two-spark Bosch magneto of enclosed type, Rushmore electric lighting and starting systems, both separate units and operating independently of ignition, distinctive and exclusive body designs.



Prices: $2600 to $2900

"There's Where YOU Are Wise!

That Other Fellow is a Menace to Everyone's Safety"

Nine-tenths of all automobile accidents are caused by skidding and by foolish dependence on rubber alone. In these days of crowded streets and congested traffic, the motorist who does not take precaution to guard against every possibility of disaster is **next to criminal.**

"The ever-present danger that is quite as much of a terror to the experienced driver as it is to the novice is **skidding.** There is nothing that makes a man lose his nerve so thoroughly or dread a repetition of the experience so keenly as a bad skid that ends in a broken wheel against a curb, or that makes matters far worse by 'side swiping' a moving trolley car. To feel the car start to slide from under you, aiming directly at the nearest obstruction, despite all manipulations of the wheel and brakes—well once is too often."

Weed Chains *vs.* Slipshod Traffic

Traffic policemen, by the hundreds, interviewed in all the large cities throughout the country, express the unanimous opinion that their work would be greatly reduced; that nearly all **skidding accidents would be eliminated** if motorists would take the precaution of always carrying WEED CHAINS, and putting them on when roads and pavements are wet, slippery and uncertain, or covered with snow.

Some of these **guardians of public safety** go so far as to say that the time is not far off when State Legislatures will make **the use of WEED CHAINS compulsory,** for the protection of life and property.

Make Safety Yours —take no chances. Fully equip your own car with WEED CHAINS and **insist,** for your own protection, that other drivers do the same.

On The Rear Tires —they afford perfect traction and adequate brake control.

On The Front Tires —they act as ladders to enable the front wheels to easily climb out of mud-ruts, car-tracks and all uneven places in pavements or roads, always insuring absolute steering control, eliminating all chance of the front wheel skid.

If you haven't a set of WEED CHAINS, or if you have a pair for the rear tires only, **get a full equipment now.** Delay is dangerous. Stop at your dealers today and **WEED CHAIN your car to safety.**

FOR SALE BY ALL REPUTABLE DEALERS **Weed Chain Tire Grip Co., 28 Moore St., New York**

THE AUTOMOBILE JOURNAL

VOL. XXXIV, No. 12 JANUARY 25, 1913 Price, $1.00 the Year

THIRTEENTH ANNUAL SHOW IN NEW YORK.

Display of Pleasure Vehicles in Madison Square Garden and Grand Central Palace Demonstrates Industry's Progress Toward Standardized Product.

THE 13th national automobile show in Madison Square Garden and Grand Central Palace, New York City, Jan. 11-18, having specific reference herein to the pleasure car section, was such as to demonstrate the progress of the industry and to leave no question as to the thorough standardization of the product. The policy pursued by many of the manufacturers in making display was changed in a measure, in that while usually the principal endeavor has been to interest dealers and in securing agencies, this year there was decidedly greater attempt to assist the dealers in making sales. Of course this always has been a feature of the national show, in a greater or lesser degree, but the statement is intended to indicate that efforts were directed more largely toward this result.

This condition undoubtedly arises from the practise, which has been gaining adherents very rapidly, of announcing new models early in the season. It must not be understood that the cars on display did not represent the very latest features of design and construction. While some of the models, as such, were announced some months before the opening of the show, the machines exhibited almost invariably revealed

Digitized by Google

refinements and changes of such character as to make them well worthy of strict examination. Many new cars were shown, the features of which had not been made public previous to the opening of the display.

The inability of the show management to secure a single building in the Metropolis capable of accommodating all of the concerns who desire to exhibit is unfortunate. While the total number of exhibitors in Madison Square Garden and Grand Central Palace under one management this year was less than that of last year when the two displays were under separate auspices, there is little doubt that many of the visitors were under doubtedly will indicate that the number of visitors at the Garden was quite as large as in former years, although it was noticeable that the patronage was much better during the latter part of the week than on the opening days. For some unaccountable reason, particularly as many new and interesting features were on display at the Palace, at no time did the attendance at this building compare at all favorably with that at the Garden.

When the volume of business transacted is taken into account, it is probable that the aggregate was less than usual. In this there will be difference of opinion among the manufacturers,

General View of the Grand Central Palace, New York City, During the Pleasure Car Section of the Show.

the impression that there was so much to be seen that insufficient time was spent in investigating the merits of the different products.

The show was most representative. For the first time, since the very earliest days of the industry, all makers were permitted to exhibit without reference to their affiliation with any national body. The allotment of space was such that most of the manufacturers longest identified with the industry were located in the Garden, while the newer concerns were more largely represented at the Palace.

In the matter of attendance the figures unsome of whom state that they made more sales than ever before at a New York show. Others contend that the purpose of a national show is to interest dealers rather than customers, and in this respect they feel that the results were not as satisfactory as heretofore.

The number of so-called show cars was much less than last year, for example, and the exhibition was one calculated to make its appeal to the practical motorist. There was ample opportunity to study constructional details, many of the makers showing chassis or components arranged in such manner as to indicate the method of oper-

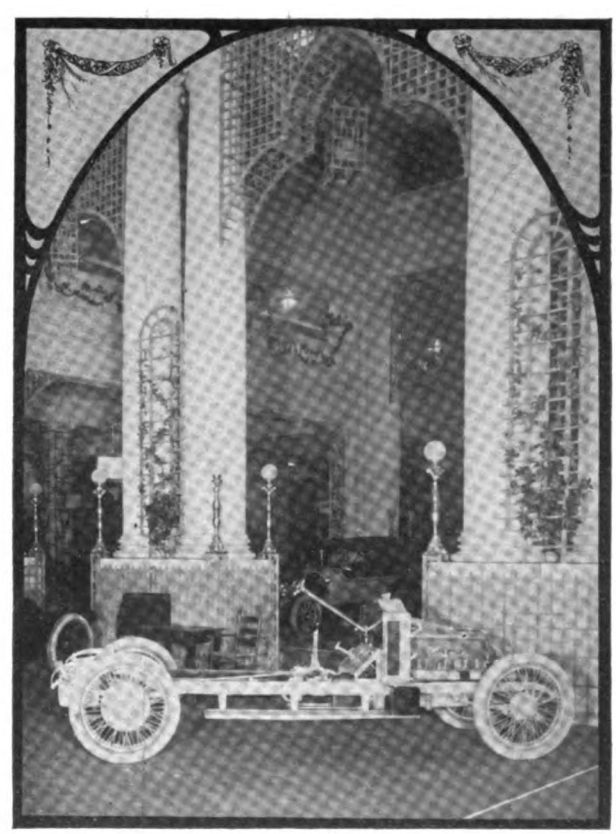
ation. The very evident object of such manufacturers was to present an educational exhibit of distinct value.



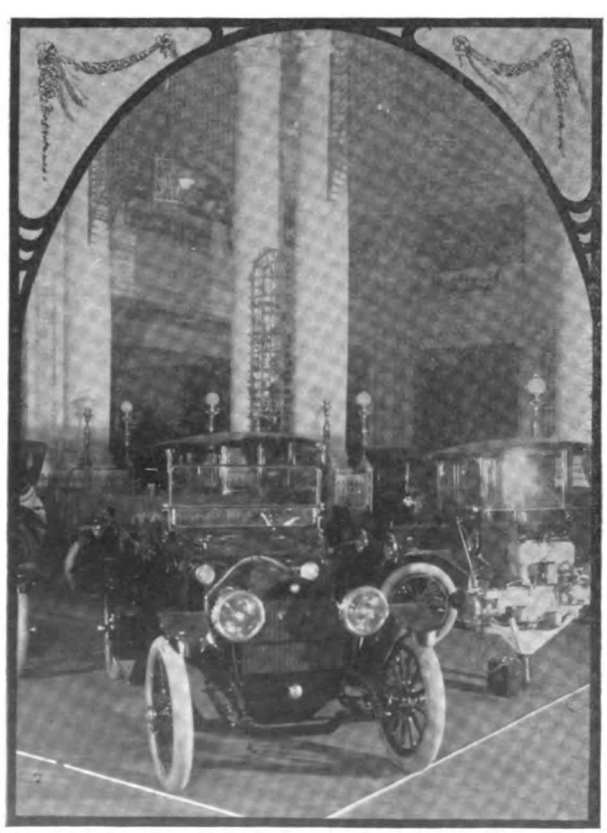
Inasmuch as automobile construction has now reached a point where it must be regarded as conventional and standardized, except for those differences in opinion among engineers which also have come to be recognized, it is not to be expected that the 1913 shows will reveal radical departures from accepted mechanical design. But with the changing conditions in the use of motor cars, certain refinements, especially those making for economical maintenance, and comfort and convenience, will appear from year to year. In this respect the New York display was especially interesting.

Last year, it will be remembered, the motor starter was just beginning to receive attention. Two years ago, several of these devices, mostly of the mechanical type, were shown at the accessory booths. Last year many cars were exhibited with starters operated by acetylene gas, compressed air and electricity, while the number at the accessory display was greatly increased. This year 81 per cent. of the cars exhibited were fitted with some form of motor starter as regular equipment, and 80 per cent. of these utilized electricity.

Perhaps no one feature excited more interest on the part of the visitors. Most of the makers equipping their cars in this manner were able to demonstrate the method of operation, and practically the first request for information was concerning this subject. The matter of fittings is taken up in more detail elsewhere.

Electric lighting also has gained many advocates, a fact that is liable to be overlooked by those who consider the starter situation first. In many instances the lighting and starting systems are a combination unit, and this undoubtedly has had its full bearing upon the installation of such equipment.

As was demonstrated in a forecast of the show, the buyer is assured of considerably more value for his money this year, because of the very general practise of the manufacturers to supply what is regarded by them as full equipment. This



Corner in the Grand Central Palace Occupied by Keeton Exhibit.

Digitized by Google

was reflected in no small measure at the accessory exhibit, many of the makers in that field striving to interest the car manufacturer in their product strictly as an equipment proposition.

Quick detachable, demountable rims are standard with a large majority of the cars. Demountable wheels, carrying quick detachable rims, offer a variation from this practise in a few instances. But the chief interest in this phase of the equipment lies in the wire wheel situation. While the number of wire wheels on display was not large when compared with the more familiar wood members, it was of sufficient proportions to excite decided comment. Three makers at the Garden exhibited one car each, while 14 machines were shown by eight manufacturers at the Palace. With some of these wire wheels are regular equipment, with others they are optional, and with still others they are fitted at an extra cost.

Wire wheels were still more in evidence at the accessory booths, several makers of such equipment being represented, while a number of tire and rim concerns presented them in connection with their own product, in which event special fittings had been produced in anticipation of a substantial increase in the demand for this type

of wheel. An investigation of the situation reveals the fact that 20 per cent. of the makers represented in both buildings are prepared to supply wire wheels, either as regular, at an option, or at an extra cost. Their advocates contend that the shows of 1914 will reveal a majority of the cars thus equipped.

Accompanying tables set forth the details of the show, insofar as pleasure cars are concerned, in a complete and comprehensive manner. It will be seen that while the six-cylinder motor has made rapid strides during the past year, the situation is such as would indicate that the four-cy-

Digitized by Google

linder machine has numerous advocates. Last year there were 305 cars and chassis fitted with four-cylinder motors in both buildings, and 69 utilized the six-cylinder unit. This year the figures are 212 and 117 respectively.

Stated in another manner, of the 85 makers represented, 42 were at the Garden and 43 at the Palace. In the Garden they were divided evenly among the producers of fours exclusively, sixes exclusively and both fours and sixes—14 each. In the Palace 22 utilized fours exclusively, five sixes only and 16 produced both fours and sixes. This indicates that the makers of fours exclusively are decidedly in the majority when compared with those who make the sixes only, although the number of four-cylinder adherents who have added sixes has increased decidedly within the past year.

The tables should give all the necessary information concerning the constructional details of the gasoline cars, particularly when considered in connection with other articles appearing in this issue. In explanation of the tables, it may be stated that all open cars having regular seating accommodations for more than two persons, whether toy tonneaus, etc., are listed as touring cars; all two-passenger machines, including speedsters, runabouts and the like, are listed as roadsters, and phaetons, coupes, limousines, etc., are listed as enclosed cars.

The number of electric car manufacturers represented was not as large as in former years, only five making display, and these were all at the Palace. Two of these also produce gasoline machines. Some of the electrics presented distinct features, among which may be mentioned the hooded steering knuckle on the Standard, which the maker contends will be adopted very generally by gasoline cars so soon as its merit is fully understood. A runabout model on the Buffalo stand was fitted with wire wheels. The Church-Field presented a sloping hood in front, somewhat after the so-called Renault type. The others represented were the Columbus and the Hupp-Yeats, both of which showed coupe models.

The subject of accessories is taken up in detail elsewhere. Many new features of undoubted practicability were revealed, and it was significant that a large percentage of these were of the electrical type. The motorcycle section also calls for special comment in another place.

One of the exhibits at the pleasure section of the New York show in Madison Square Garden which attracted unusual attention was that made by the Springfield Metal Body Company, Springfield, Mass. The convertible body, brought out by this concern a year ago, was again the centre of interest. By its use the car owner is supplied with a body readily adaptable to all weather conditions, inasmuch as the machine may be changed from a fully enclosed to an open type in a very few minutes. This body is now optional equipment with several car manufacturers.

Main Floor of Madison Square Garden, New York City, Pleasure Vehicle Section, White Cars in the Foreground.

The Auto-Motor Club, formerly the Omaha Automobile Club, Omaha, Neb., has discarded the new and resumed the older name. Officers for the coming year have been elected as follows: President, Gould Deitz; first vice president, Harry Lawrie; second vice president, B. W. Jewell; treasurer, W. D. Hosford; secretary, Lee Huff; assistant secretary, D. M. Carr.

NEW MODELS OF SERVICE WAGONS SHOWN.

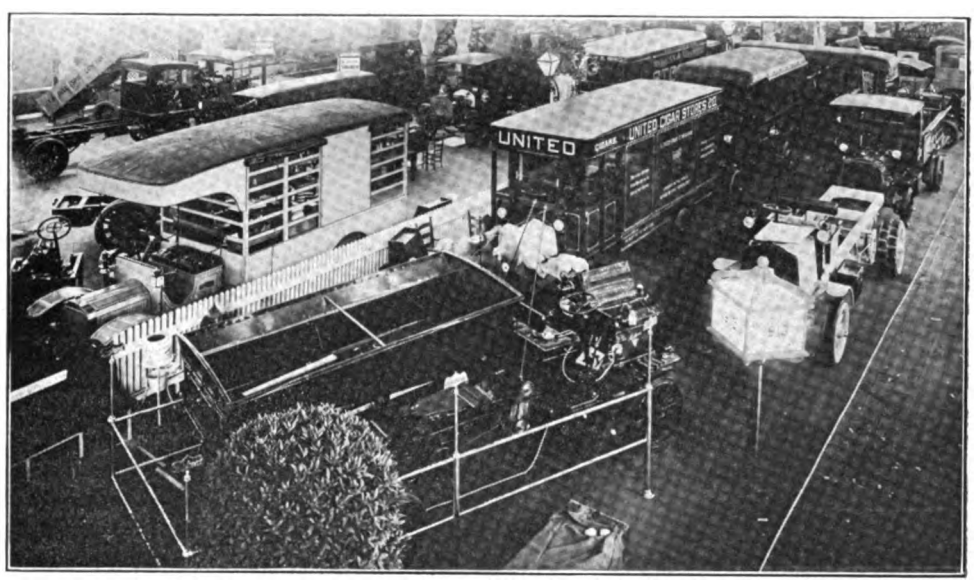
Worm and Concentric Gear Drive Attracting Attention of Industry, and Makers Take Up Tractors and Special Body Equipment.

THE service wagons exhibition, officially known as Part II of the annual show at Madison Square Garden and Grand Central Palace, New York City, which was inaugurated Jan. 20 and closed the evening of Jan. 25, was by far the best and most interesting display of machines ever made in America. This is not applied as to number of exhibitors or to number of vehicles shown, but to the progression in engineering and the development of types that are best suited for differing purposes.

The attendance was small as contrasted with the number who visited the pleasure car show, but this was from the fact that women are seldom interested in the machines designed for freight transportation, and the visitors were generally those who were investigating haulage and desired to avail themselves of the opportunity to make comparisons and to learn from observation the qualities of vehicles that might be available for varying uses.

Section of the Main Floor, Madison Square Garden, Looking from the Elevated Platform from the Madison Avenue End.

The show, so far as the vehicles were concerned, consisted of 62 different exhibits, of which 22 were at Madison Square Garden and 40 at Grand Central Palace, but the actual displays of makes was larger, for the International Motor Company showed three makes in its stand, and the Studebaker Corporation had both gasoline and electric machines in one exhibit. Segregating these makes, the total was brought to 65. It is not possible to represent the proportions of the shows by the number of sizes and types built by each exhibitor, for in some instances not more than one or two machines of a line were shown, and in others the full production of the maker was to be seen.



The show may be, for the purpose of review, divided into the Madison Square Garden and the Grand Central Palace groups, and considering these the former was generally of the larger and well known builders, who have reached what is termed the standard model, while the latter was composed of those not as well known in the industry, but who have produced some extremely interesting and progressive types. With many of the older makers comparatively few changes were to be noted, and in several instances the machines were identical with those shown a year since, while great attention was directed toward display of body equipment and devices for facilitating handling of freight.

The statement made, however, does not apply to the electric vehicles, which were all seen at Grand Central Palace, and which were all shown by the largest and oldest makers, but the western manufacturers were not as generally represented as at previous exhibitions. At Madi-

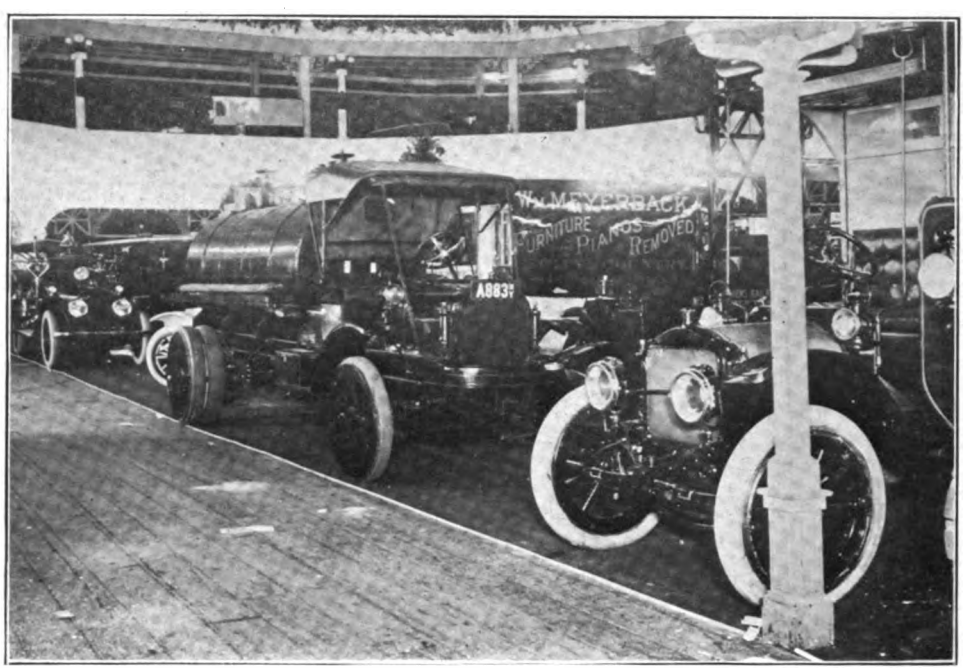
Digitized by Google

son Square Garden the entire main floor and elevated platform were given over to the exhibits, and practically all the available space was utilized, but only the main floor at Grand Central Palace was occupied, the second or balcony floor being closed for this portion of the show.

Considering the show from the viewpoint of the manufacturer it afforded possibilities for studying the differing constructions that impelled the attention of engineers and designers from practically every concern in the industry, and the exhibitors were impressed with the fact that corporations having to do with haulage to any material extent demanded investigation by their engineers and experts with the view of obtaining practical information. There is no doubt of the fact, a condition that was emphasized with every exhibitor, that those who have large haulage services are impressed with the necessity of having the most careful data on vehicles that can be obtained, and that such concerns are seeking them systematically. That is to say, that instead of awaiting the visit of the salesman or representative of the wagon manufacturer and obtaining the information that the single individual can or will impart, those who are considering large installations are carefully studying the market and learning what may not only be best adapted for their use, but are ascertaining facts relative to service and maintenance, and giving careful attention to body equipment.

Service Wagon Exhibition, Madison Square Garden, Seen from the Elevated Platform from the Fourth Avenue End.

The care with which some of the manufacturers displayed devices for quick handling of freight, for protecting loads from damage during cartage, and special apparatus for specific work manifested a realization of the demands that have been or will be made, and while there was a limitation as to what might be shown there was no doubt of the study that has been directed toward development of what will make the vehicles more useful and more economical in differing works.



From a mechanical point of view the machines were never so interesting. While it is true that several of the manufacturers have made few changes, and others have made refinements that are seemingly of an unimportant nature, there has been a very general tendency to strengthen the chassis, to increase the proportions of members and to make them more enduring. One fact that is especially noticeable is the adoption of a single design and to build chassis of different capacities to this, the effect being a standard type of such sizes as may be desirable to produce. There are numerous advantages obtaining in a standard design, which simplifies engineering and manufacturing, as well as service attention. There are instances, of course, where conditions and requirements may impel the adoption of more than one, but this is not the rule.

Taking up the industry from the viewpoint of vehicle capacity it would appear that there is a disposition by some manufacturers to build large machines, these being especially adapted for heavy haulage, such as coal, gravel, sand, cement, building material, lumber and the like, and for use in construction of different characters. There are others who specialize adaptations for large loads, these either utilizing the trucks for tractors or having such equipment that dead wagons may be used for loading and quick handling. Still another group has developed the vehicles of lighter type, these being designed for fast delivery work and being very strongly built to withstand the stresses to which they shall be subjected. Several have decided to build machines that will, so far as capacity is concerned,

Digitized by Google

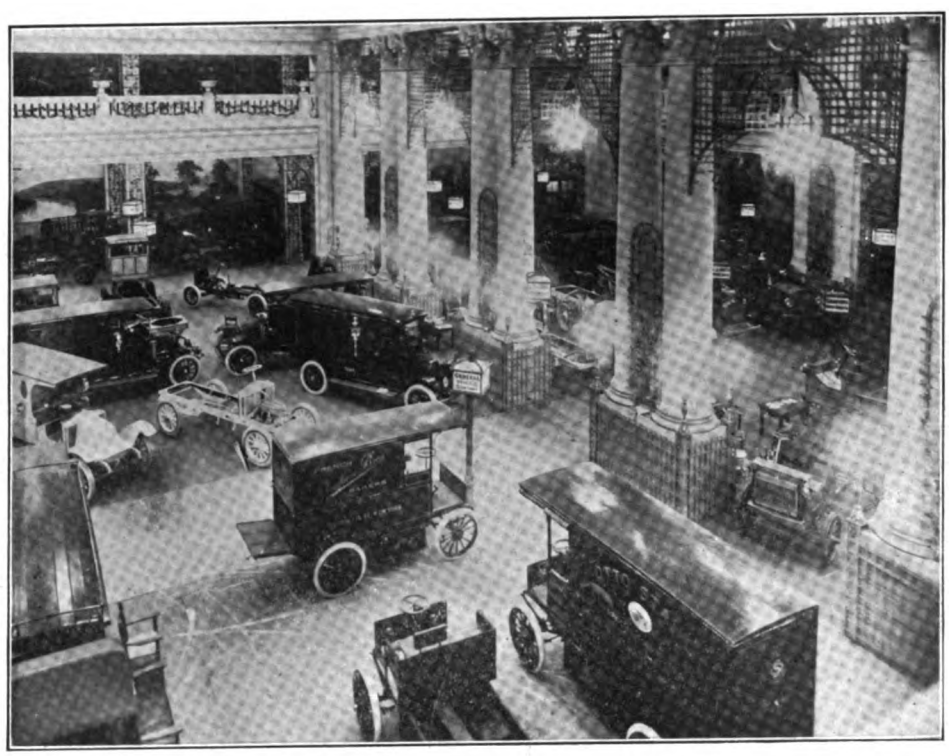
meet with a very large demand, or perhaps it may be better to state that they have sought to supply all requirements from the light, fast machine to the largest truck.

There were numerous facts impressed upon the visitors. One of these is the very evident attention given by manufacturers of vehicles of large capacities to the possibilities of utilizing tractors. Tractors have been generally used abroad for years, where the highways are more uniformly improved than in this country, and the results obtained in Europe and the demand for economy of haulage has directed attention toward tractors and traction vehicles. It may be best to differentiate the tractor as an automobile vehicle that when combined with another that

A Glimpse of the Main Floor of the Truck Show at Madison Square Garden.

will carry a part of the load, carries a portion of a load and draws it all, while a traction vehicle is that to which trailers may be attached and drawn. Abroad the two are classified as tractors and traction engines, but the latter term does not adequately define the machine. Literally, tractor means to draw or a method by which drawing is accomplished.

Highway tractors have not been generally developed in America, and even now the number building them is very small, but there was shown at Madison Square Garden a tractor in which the motive power was a five-ton Garford chassis, and the body and carrier was built by the Shadbolt Manufacturing Company, this being a dumping equipment with a capacity of 12 tons. The Knox Automobile Company specialized the Martin tractor, which was shown a year ago, and which is well known, while the Locomobile Company of America and the American Locomotive Company showed two well adapted dead wagons. The Locomobile outfit was designed especially for haulage of lumber, two or more wagons being utilized, which are loaded in the yard, hauled to a convenient place if necessary, and from which the loads are drawn onto the truck by power. The Alco adaptation is a body that may be drawn onto the platform of a truck from a dead wagon, which may be dumped if desired, or the dead wagon may be used as a trailer. No other tractors or trailers were shown, but this was largely because of the limited space available and large area necessary to properly display them. It should be stated, however, that the Baker Motor Vehicle company is regularly building an electric tractor, Couple-Gear Freight-Wheel Company is also building electric and gasoline-electric tractors, and the La France Hydraulic truck has been within a comparatively short time experimented extensively with as a tractor.



There has been as well a decided attention given to the use of the worm and gear for power transmission. At Madison Square Garden the Pierce-Arrow trucks were the only machines in which this form of drive is utilized, but at Grand Central Palace were to be seen the Smith trucks, the Rowe, the Universal, the Blair and a one-ton Studebaker electric in which the drive is by worm with the motor carried on a frame that serves as radius rods. The Schacht one-ton worm driven machine was to be shown but this will not be ready for display for perhaps two months. All the Smith machines have this form of drive, as well as the Blair, but the Universal, the Rowe and the Schacht are in but one model only. The Smith six-ton truck is the largest

Digitized by Google

worm driven machine built, and the five-ton Pierce-Arrow and Blair trucks are next in size. Then come the Smith and Blair 3.5-ton trucks, the Blair 2.5 and 1.5-ton machines, and then the Rowe, Universal and Schacht one-ton wagons. The Universal one-ton chassis has the Wallwork type of worm and gear, which construction is now built in this country, but the others are American developments. Strong claims are made for the efficiency of the worm drive by those who have adopted it and there has been a gain in its use each year. The type of vehicle ranges from the 1000-pound electric wagon of the Commercial Truck Company of America to the Smith, and the users include two electric and 10 gasoline machines.

The concentric gear drive has made considerable gain, there being three different makes of machines shown at Grand Central Palace. These were the Mais, which is the oldest and best known, and the Brown and the Studebaker, both of which are new. The Studebaker is the first gasoline truck produced by the Studebaker Corporation, and it is of three tons capacity. It is understood that this will be followed by a series of sizes to the same design. There are three other manufacturers using this form of drive for gasoline machines, and three others for electric vehicles. The Mais and Studebaker are designed by the same engineer, and while the principles of construction are similar there is a considerable variance, and the latter has a unit power plant that is unusual in that the steering column and pedal shaft are assembled with it. The machine has three brakes, the service and the first emergency being on the propeller shaft, and the second emergency on the rear wheels. The brakes are all of the contracting type, but that on the rear wheels has V shaped shoes that engage with flanges of the same shape on the gear housing. The design has been very carefully developed and worked out with a regard for endurance that is secured through protection of the working parts.

The Brown wagon, of 1500 pounds capacity, carries the counter or jackshaft back of the dead rear axle, instead of in front of it as in the Studebaker and Mais, and the brakes are internal expanding and external contracting on the drums on the rear wheels. The power plant of this machine includes the clutch and service brake pedals and the gear shift levers in the assembly, so that there is no strain on the unit from chassis distortion. Another interesting display is the Latil two-ton wagon shown by the Walter Motor Truck Company, which has secured the American manufacturing rights and will build the vehicles in this country. In this the drive is through a cross or countershaft directly back of the motor to the front wheels by spur gears that mesh with pinions on the countershaft. The power plant is mounted on a chassis carried by the front wheels, which may be detached from the vehicle, and in this respect it is similar to the Christie front wheel drive. The machine when assembld as a freight wagon carries the load on steel tires at the rear. The Latil vehicles have been used for nine years in France and have been subjected to the tests of competitions with, it is claimed,

Main Floor of Grand Central Palace, Seen from the Balcony on the 46th Street Side.

Digitized by Google

uniform success. The Latil-Walter will be built in sizes to meet the demands of the market.

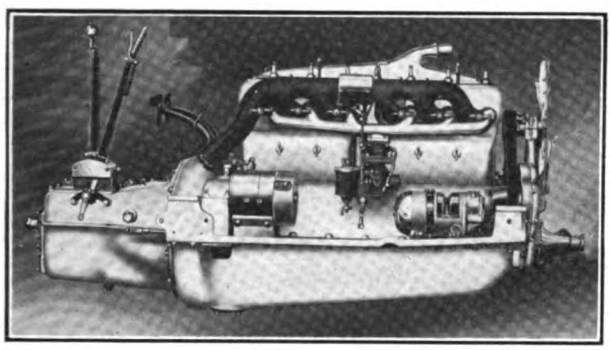
The new 2500-pound KisselKar wagon is noticeable from the fact that the sub-frame that carries the power plant and gearset is mounted on three points and protected against chassis stresses by helical springs which absorb all shocks and the radiator is enclosed in an aluminum frame. The new Selden 2000-pound wagon is built to a conventional design and is an extremely sturdy and well developed construction. The new Reo 3000 to 4000-pound wagon has a sectional radiator from which one or several sections may be removed and the use of the machine continued. The radiator is protected by a heavy plate that forms a bumper and which carries the front hangers of the forward spring. This plate is reinforced by wood. The motor is governed by a hydraulic regulator that is claimed to be remarkably efficient.

The new Buick, 1500-pound delivery wagon is a well conceived design and is not in any sense radical. It has an en bloc motor that is rated at 14.4 horsepower and with a bore of three and stroke of five inches will develop nearly double its rating. This will be followed by another machine which will have a capacity of 1000 pounds. The Hupmobile delivery wagon has a touring car chassis fitted with auxiliary springs. The Willys Utility wagon has a capacity of 1500 pounds and this is a chain driven chassis of conservative design developed to do freight work. The Packard line has been completed by the addition of a five-ton machine that differs from the other designs in the support of the jackshaft, the use of large locomotive type brakes and the rear axle and spring suspension. The new Krebs machines shown included shaft and chain driven types with two-cylinder, two-cycle motors, and a four-cylinder power plant is installed in either form of chassis at the desire of the purchaser.

The Service Motor Car Company has added a three-ton truck to its line that follows the previous designs. The new Standard truck was shown for the first time. The new Vulcan seven-ton truck, which is an entirely new production, is a refinement of the previous designs built, and it is to be followed by one and two-ton wagons that should be placed in the market about April 1. The Flint model C delivery wagon, with capacity of 1600 pounds, was shown for the first time. It has several interesting features. The new Pope-Hartford five-ton truck was seen for the first time, this having been announced just previous to the show. It is a larger edition of the three-ton machine, but both have been somewhat improved. The Atterbury new shaft driven 1500-pound delivery wagon is a handsome construction and well designed. The Sanford Motor Truck Company showed for the first time a 3000-pound machine that follows the same general design of the one-ton wagon that has been known for the past two yeards. The Croce Auto Company's machines were shown for the first time, although they have been built in a small way for a number of years. These vehicles are decidedly interesting mechanically.

The Bessemer Motor Truck Company has added to its line a 1500 and 3000-pound wagon, both of which are to the design of the original one-ton machine. The Dart Motor Manufacturing Company showed new 2000 and 3000 pounds capacity wagons, these having four-cylinder motor equipment and a decidedly interesting gas control by pedal. The Maccarr Company displayed its machines, which have just been produced, and are to standard principles. These are of 1500 and 2000 pounds capacity. B. A. Gramm's trucks in two and 3.5-ton sizes were shown for the first time. The Chase 500-pound delivery wagon, although first placed in the market about six months since, was the latest product displayed. The new Kelly one and three-ton machines were a feature of the Madison Square Garden show and a new one-ton Mack wagon attracted much attention. The Stewart 1500-pound delivery wagon was a new exhibitor, the first machines having been marketed for considerably less than a year. The Stegeman two-ton model is a new product, and this line has a number of decidedly interesting features. The Decatur machine has been decidedly improved by refinement that should add materially to its usefulness and service.

Of the electric vehicles the General Vehicle, Atlantic, Baker and G. M. C. designs were not changed, but the Lansden line now includes a one-ton direct driven chassis, and the Studebaker one-ton wagon is fitted with worm drive. The Waverley 1000-pound wagon is a development from the 600-pound machine, which is no longer produced, while the Ward exhibit was a series of four machines, one, two, three and four tons capacity, which are entirely new.



President George A. Kissel of the Kissel Motor Car Company, Hartford, Wis., maker of KisselKar trucks and pleasure cars, believes that motor vehicles will supplant trolley lines at no distant day. Mr. Kissel points to the remarkable increase in the use of such cars, especially in London and Paris.

CONSTRUCTIONAL DETAILS NOTED AT SHOW.

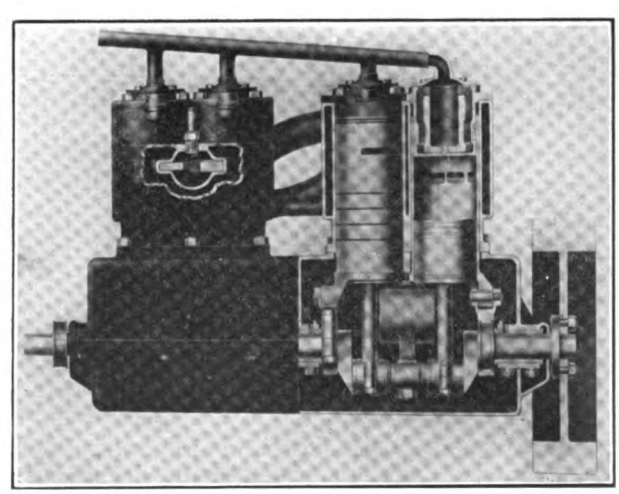
New Features Are Refinements of Conventional and Standardized Design—Demand of Motorist for Comfort and Convenience Fully Met by Manufacturer.

ALTHOUGH those interested in the mechanical features of the 1913 models have become more or less familiar with the chassis

Unit Power Plant, Enclosing Flywheel, Clutch and Transmission—Note the Location of Electric Motor Starter and Method of Enclosing Driving Gear.

details through the early announcements of the manufacturer, the cars displayed at the New York show proved of interest, especially to those who visited the exhibition to inspect the many refinements making for accessibility and easy maintenance. While it may be said with truth that the automobile has reached a high degree of perfection and that its components practically were standardized several years ago, there always will be revealed at the annual shows new details in construction and design which, while not in any sense radical, are of particular interest to the motorist.

Of the exhibit as a whole it may be stated that the industry is offering to the prospective purchaser considerable more value for his money than heretofore, in that the 1913 automobile provides more comforts and conveniences than that of a year ago. This is demonstrated in the matter of starting for example. Last year about 4 per cent. of the cars were equipped with some form of motor starter, while the figures of the industry for 1913 show that nearly 70 per cent. of the output of the factories of this country are fitted with this convenience. In a similar manner the policy of the manufacturer to provide refinements is noted in the almost universal adoption of electricity as an illuminant.



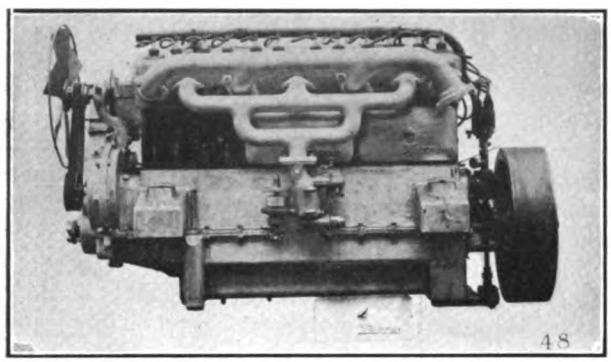
Many New Cars Shown.

There were many new cars shown and some of these made their first public appearance. A few names, well known to the motoring public, were missing, and while some have turned to the production of commercial vehicles others have dropped out of the ranks of automobile manufacturers. Most prominent among those missed by the veteran attendant at the show were the Thomas and the Corbin.

The show demonstrated the fact that the poppet valve motor has not been losing ground and that the advocates of the non-poppet design have been increased by only two, one a Knight and the other a rotary valve type. The maker of the former, the Edwards Motor Car Company, is a new entrant to the ranks of builders, while the Speedwell Motor Car Company displayed a six-cylinder Speedwell-Mead motor, a complete description of which will be found elsewhere in this issue. The single-cylinder and two-cycle power plants were not shown. Last year the former was represented by the Brush and the latter by the Elmore.

One New Motor Presented.

One new motor made its appearance, the Twostroke, which was exhibited in the accessory division at the Madison Square Garden. It recalls the two-cycle motor in that there is no half-speed mechanism and that it presents the



The Twostroke Motor with Section of Cylinders Cut Away to Show Sleeve Valves and Ports.

absence of moving parts, which was one of the slogans of the advocates of the two-cycle design.

The new motor operates on the four-cycle

Digitized by Google

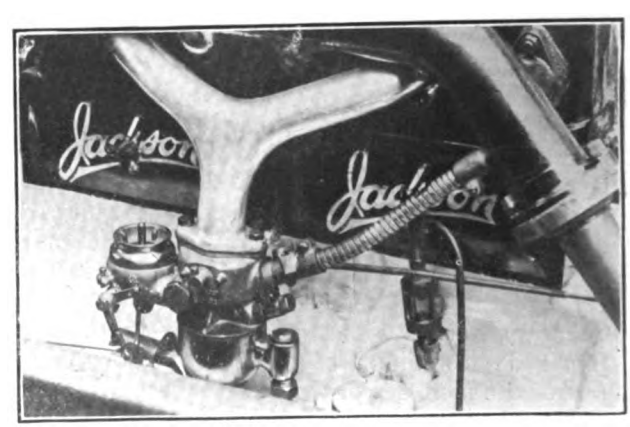
principle, however, and comprises four cylinders with two pistons working on the same level at each end. Each pair of cylinders is provided

An Example of Six-Cylinder Motor Cast en Bloc, and with Peculiar Design of Intake Manifold.

with a firing chamber, having a port opening into each of the cylinders within which are sleeve valves having ports which open the firing chamber first to one cylinder and then to the other. These sleeves are operated by eccentrics on the crankshaft. One of the cylinders has an intake port and acts as a compressor. The other cylinder is provided with an exhaust port and is the power member. Each charge of gas passes through both cylinders and the firing chamber in its cycle through the engine.

How It Operates.

When the pistons are at their highest point or firing position, the intake port is open and that communicating from the intake cylinder to the firing chamber is closed. As the piston descends the charge of gas is taken into the cylinder. At the completion or bottom of the stroke the intake port is closed and the port connecting with the firing chamber opens. On the up-stroke of the piston the charge is compressed into the explosion chamber. No compression space is provided in either cylinder and the pistons consequently rise to as near the head as mechanical construction will permit. Compression is secured through the firing chamber, the condition being similar to that obtaining with the L space of an L head motor.



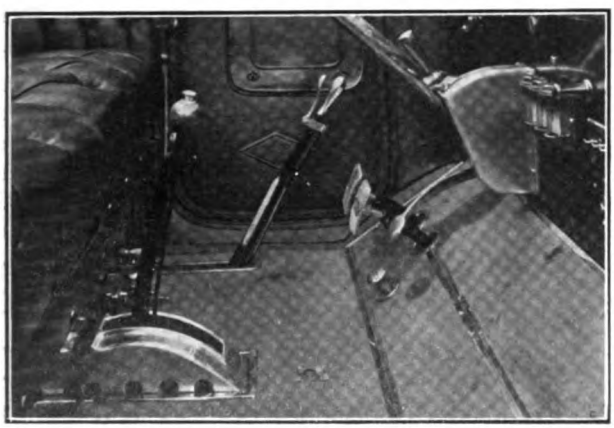
When the pistons reach the top of their stroke the port into the compressor cylinder closes and the port leading into the working cylinder opens. The firing chamber then practically becomes the L of the L head for the power cylinder. At this point the charge is ignited and the gases passing through the port and over the piston in the working cylinder force it downward by their expansion. Near the bottom of the stroke the exhaust port opens and that of the firing chamber closes shortly afterward. On the up-stroke the burnt products are exhausted. Each cylinder performs but two of the four strokes of the cycle and two different movements take place at the same time in the different cylinders. The name of Two-stroke is derived from this operation.

The inventor claims that by the action the working cylinder provides a power impulse every revolution of the crankshaft, while the compressor cylinder furnishes no work at all. One of the features of the motor is held to be power and efficiency at high speeds, due to the positive intake. Economy of fuel is also claimed and simplicity in that there are but 17 moving parts. The rights to the motor are held by the Duplex Gasoline Motor Company, 42nd street and Broadway, New York City, and the company will grant licenses for the construction and use of the design.

Numerous Sixes.

To the casual observer it appeared that cars fitted with six-cylinder motors were numerous and statistics bear out this assumption, showing that there has been a noticeable increase in the number of makers marketing a six-cylinder model. Many who produced this type brought out new designs and a large number of other makers who heretofore confined their efforts to the building of fours, displayed a six in addition. This tendency was not confined to the high priced machines for numerous automobiles of the popular price class were displayed with six-cylinder power plants.

Some idea of the increase in sixes may be gathered from the fact that of the 329 cars, in-



Showing How Hot Air Is Taken from the Exhaust Manifold on the Jackson Car and Led to the Carburetor Through a Flexible Metal Tube Tapped into the Exhaust Member.

cluding chassis, 117 were fitted with motors of this type, a percentage of 36, and greatly in excess of last year. The popularity of the six is ac-

Digitized by Google

centuated when it is considered that about 13 per cent. of the motors in 1911 were sixes, and 19 per cent. last season. By these figures it will

Location of the Control Lever of the Electric Motor Starter on the White and Indicating Convenience of Lighting Switch and Other Control Members.

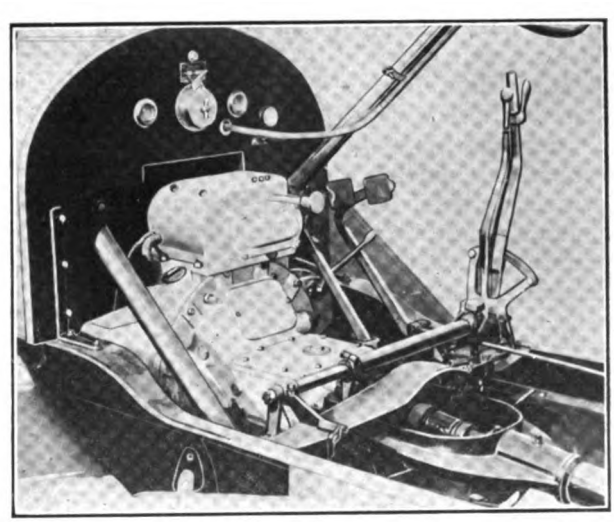
be seen that there are nearly 100 per cent. more sixes this year. Some makers even go so far as to predict that 1914 will see the number of sixes equal that of the fours, if not surpass the latter in popularity.

Smaller Bore, Longer Stroke.

While to many the motors appeared similar to those exhibited last year a number of new designs have been brought out. There have been no radical changes in the principles of operation, but many of the standard features have been redesigned and rearranged, making for easier maintenance, accessibility, longer life and more efficiency from an equal amount of fuel.

The tendency to employ a longer stroke which was prominent last year is even more noticeable, and the motor manufacturer has also adopted the foreign practise of reducing the bore. The increase in the stroke is pronounced in many instances. Last season the average stroke was 1.15 times as great as the bore, while this year it is 1.23, or approximately 25 per cent. greater.

This is shown by the average cylinder stroke of 5.15 inches against 4.97 in 1912. The average cylinder diameter of the 1913 motors is one-eighth less than in 1912, being 4.19 inches. This decrease in cylinder bore and increase in stroke has altered the ratio of bore to stroke very appreciably since last year. The different bores and strokes of motors exhibited will be found elsewhere, also the bore to stroke ratios. Relative to the figures it may be stated that the average ratio in 1912 was 1 to 1.13 as against 1 to 1.33 this year. Extremes in stroke were noted in one instance, the bore being 4.25 inches and stroke seven. Another well known make of car is fitted with a motor the cylinders of which have a bore of 3.75 inches and stroke of 5.5.

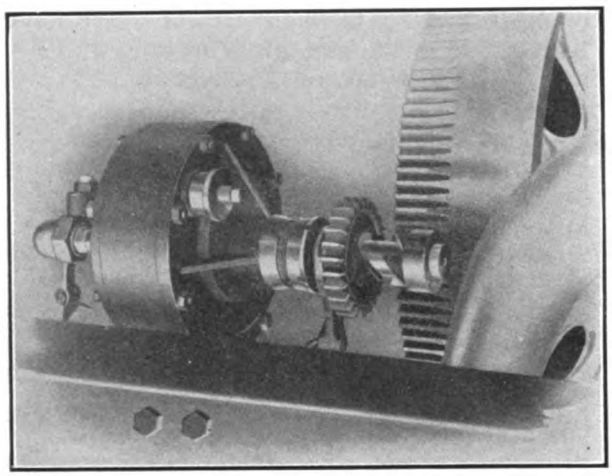


Horsepower Production.

With the smaller bore it would appear that the rated average horsepower would be considerably less than of 1912, when it is remembered that the S. A. E. formula considers the bore the important factor. The average rated horsepower remains practically the same as last year and this may be explained by the increase in the number of sixes without which it is obvious that the average would have dropped materially.

The 1913 motor is an improvement of those of the previous year in that great efficiency is secured and this appears to be borne out by the brake tests of a large number of the new engines. For example: The Mercer four-cylinder motor, having a bore of 4.5 inches and stroke of five is rated at 32.4 horsepower by the S. A. E. formula, but it is held to show a dynamometer pull of 58 at 1700 revolutions a minute.

The increase of stroke is not alone responsible for the increased efficiency. Valve diameters, valve lifts and port areas have been increased as a result of lengthening the stroke, making for quicker introduction of the mixture into the cylinder and expulsion of the burnt products. Back pressure is reduced to a minimum and there is more complete use of every particle of energy in the fuel.



As a result of these improvements in valve

The Electric Motor Starter on the Pathfinder Is Mounted Over the Flywheel, Completely Enclosed, and Is Actuated by a Rod Member.

construction many machines are conservatively rated, even by the S. A. E. formula, but as pointed out, the horsepower production is greatly in

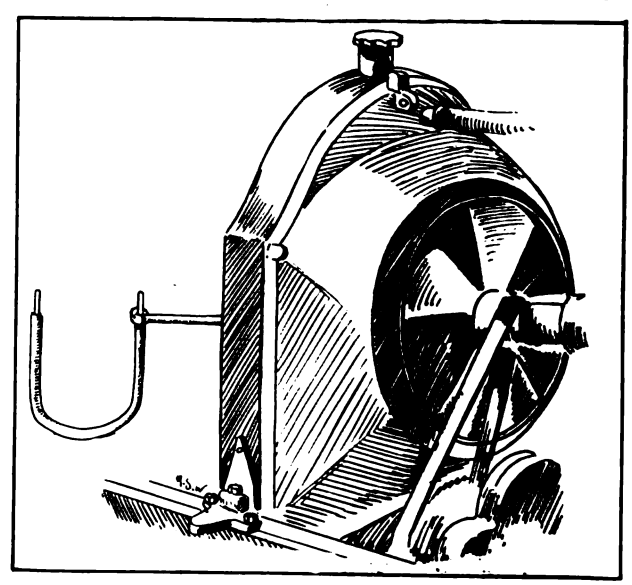
Digitized by Google

The Chevrolet Utilizes an Air Motor Starter and Employs a Clutch Device for Engaging the Driving Gear with the Teeth on the Flywheel.

excess of that rated. Greater efficiency from the same amount of motor fuel is an appreciable quality in these days of the constantly advancing price of gasoline.

Cylinder Shapes.

Although the advocates of the T head, L head and straight cylinders remain about the same, insofar as numbers are concerned, several makers have changed the positon of the valves, placing them on one side or using the T head construction. Some manufacturers offer both the T head and L head types, while others present the straight head type in addition to either of the forms previously named. The straight cylinder design, with valve in the head, is retained by the Knox, Cunningham, Franklin, Matheson, Chalmers, Pope-Hartford and others.



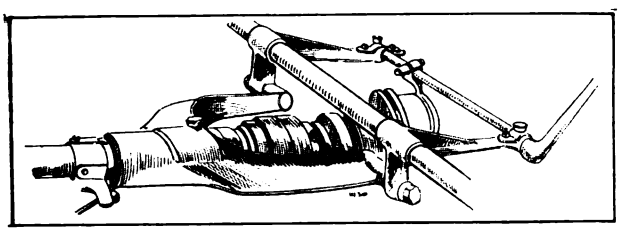
Casting the cylinders en bloc has increased in popularity among the makers during the past year and this is particularly noticeable in the six-cylinder motors, where the additional cylinders require careful consideration in the matter of casting to provide proper bearing supports for the crankshaft. Several makers have taken up the en bloc casting for the first time this year and the majority of these motors display a tendency toward the long stroke. The new Inter-State six is an example of the en bloc casting as are the Herreshoff, Flanders and others. The majority of the sixes, however, are cast in pairs, about 20 per cent. in threes and the balance singly. In the matter of fours, casting in pairs leads in numbers, although almost as many makers advocate the block. Individual cylinder construction is noted in Overland, Rambler, Kline Kar and Cadillac, the last named utilizing copper water jackets as heretofore.

Fewer and Larger Bearings.

Designers of the new motors, particularly sixes, have increased the diameter of the crankshaft and decreased the number of bearings. The size of the bearings has been increased and one maker has changed from ball to plain and reduced the number of bearings materially. Hollow crankshafts are being utilized, a construction making for lightness and permitting of increasing the diameter without adding to the weight.

An analysis of the methods of cooling resulted in showing a loss for the thermo-syphon as compared with 1912. The gear pump has gained many advocates and of the 329 models displayed 247 utilized this form, about 75 per cent. The thermo-syphon was employed on 78 cars shown, and the figures of the industry indicate that there are less cars thus fitted by 22 per cent. than last season. Five air-cooled machines were exhibited, these by one maker. The makers favoring cellular radiators have increased since 1912, although the tubular type is still employed largely. V shaped radiators have been adopted by several manufacturers. Another evidence of the influence of foreign design is found in the location of the fuel tank under the cowl of the dash, several instances of this installment being noted. That the method has its advantages cannot be denied, especially when ascending steep grades, as a constant flow of fuel to the carburetor is assured.

In the matter of lubrication many makers have adopted the method of feeding the lubricant under pressure through drilled crankshafts. Motors employing this construction for supply-

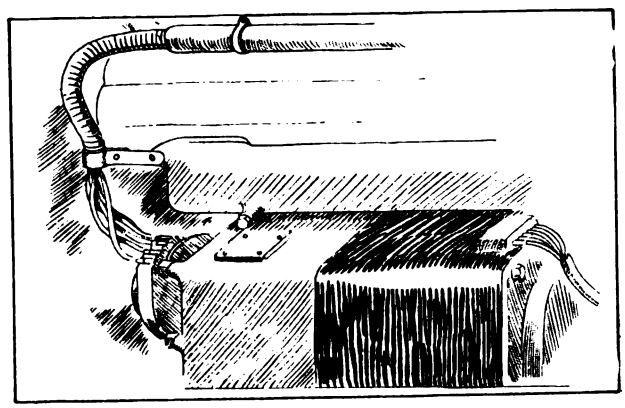


The Bergdoll Employs a Housing on the Back of the Radiator to Assist the Cooling Qualities of the Fan.

Digitized by Google

ing the oil to the connecting rod bearings include the White, Stutz, Alco and Marmon and one maker displayed a drilled crankshaft through which the lubricant was forced, spurting out through the openings. In two makes in place of drilling, tubes were secured to the connecting rods and the lubricant conducted through them from the lower to the upper wristpin bearing. In all of these types there are leads to the main crankshaft bearings. Lubrication through drilled crankshafts is accomplished either with or without the utilization of splash to the other bearings of the motor. In some designs the wristpin and even the cylinder walls are lubricated by pressure through tubes along the connecting rods as previously explained.

Circulating systems are found on the majority of the motors, the remainder being about equally divided between the mechanical vacuum and gravity feed methods. All of the last named are of the non-circulating type in which the oil is fed to the bearings at the predetermined rate and does not return to the source of supply to be

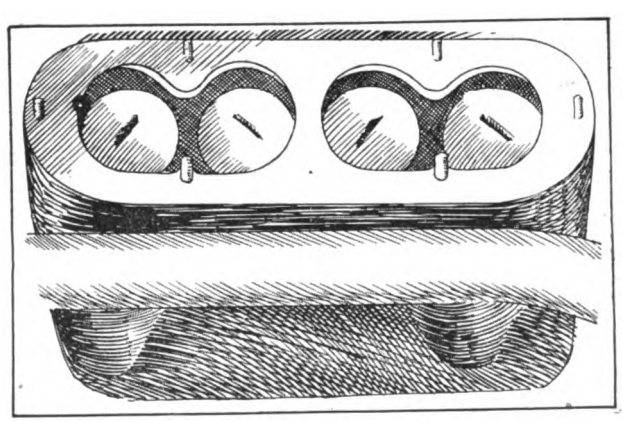


Illustrating the Universal Joint of Stutz and Method of Mounting Torque Member.

used over again. The circulating system may be defined as where the oil is used over and over again and is filtered. It was noticeable that the users of the combination splash and pressure system have increased in number over the previous year. Some designs incorporate leads to the timing gears and one maker makes provision for lubricating the clutch collar.

Accessibility of Oilers.

In the refinement of the power plant it is noticeable that the designer has located the oil filler member in a more accessible place and that the size of the opening has been materially increased. An example of well designed breather and filler member is the Marion. The aluminum tube is ample in size and is fitted with a calibrated glass window by means of which the proper oil level may be determined easily and without guesswork. The top of the filler is solid and a number of square openings on the side provide for the escape of any crankcase compression. The design makes it a simple matter to replenish the supply of lubricant, the oil hole

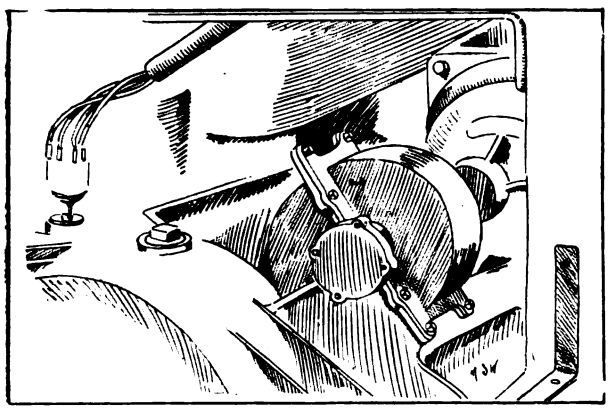


Indicating the Tendency of Some Makers to Utilize a Combined Magneto and Lighting Generator.

being very large and flaring in shape. Many makers provide an oil device indicating the supply of lubricant in the reservoir and being so located as to be very accessible.

Improved Carburetion.

Although motor starters are standard equipment with a large number of cars the manufacturers of carburetors and ignition have come to the aid of the maker in his effort to make the motor start easily. The most popular method is to restrict the air inlet and flood the vaporizer, the object being to enrich the mixture. Both of these operations are accomplished from the seat and while with some cars the control levers are installed on the dash, with others the controls are fitted to the steering column. Another method is to inject gasoline directly into the cylinders or intake manifold.



The value of utilizing heated air from the exhaust pipe or manifold is recognized by several manufacturers and in the redesigning of the motors some have installed the carburetor on the opposite side from that of the intake manifold, passing the intake pipe between the cylinders. This method heats the mixture in that the walls

The Valves of the Imperial Motor Are Reached Easily by Removing a Plate Retained by Seven Studs.

Digitized by Google

of the pipe are heated by their proximity to the hot water in the water jackets. In some instances this has resulted in a very long intake

The Combined Motor Starter and Dynamo of the Inter-State Rotates the Crankshaft by Silent Chain Enclosed by an Easily Removed Housing.

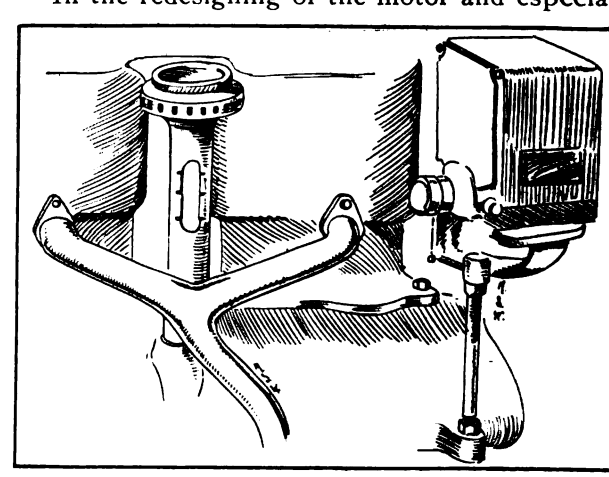
pipe and with one motor it is noted that the designer has placed the carburetor in a very high position and near the top of the cylinders.

Heating the Mixture.

The Pierce-Arrow makes use of a hot air horn which is placed at the left of the rear cylinder and in proximity to the exhaust pipe. The horn is covered with a fine mesh metal screen, preventing the suction of the pistons drawing any foreign elements into the air intake of the carburetor. Connection between the horn and air intake is by a flexible metal cable, neatly clipped.

In the Lozier a large flexible tubing is employed, this being very short. This tubing is secured at the lower end to the air intake of the carburetor, while the other is attached to a hood on the exhaust pipe. Water jacketing is also employed. On the Jackson the exhaust manifold is tapped to take a nipple to which is secured the flexible tubing, and the heated air is led through it to the carburetor. A new priming cock was shown on the Garford, it being provided with a two-way valve, and by moving the lever into one position the cylinder may be primed, while another movement closes the opening and allows the color of the burning gas to be noted. This is accomplished through the use of a glass window at the top of the device.

Silencing Operation.



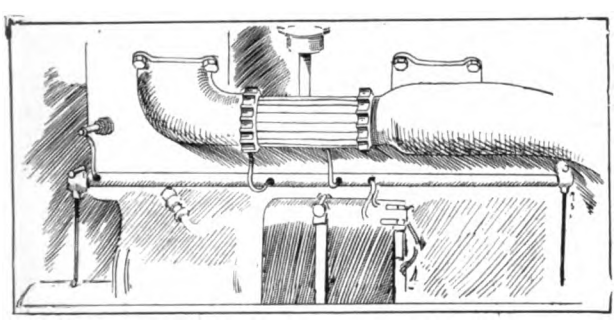
The manufacturer has continued his effort to produce the silent motor and last year the enclosing of the valve mechanism was almost universal. This feature is continued this season with a change by several to the use of the silent chain for operating the valve camshafts, pump-shaft, magneto, etc. While the growth of the chain drive is not as marked as might have been expected, due to questions of manufacture, there are about a dozen makers who employ this method. Noiseless operation is secured through another application—that of employing helical, spiral or herringbone teeth on the timing gears.

Ignition.

In the matter of ignition, statistics of the show indicate that dual ignition is largely in the majority, 200 of the 329 cars, representing 54 makes, being thus equipped. About 27 per cent. utilized the magneto as a source of current, 89 cars representing 23 makes using this form. While a large number of the electric lighting installations permit of the utilization of the storage battery as a source of current for ignition purposes, but 10 per cent. having this equipment rely upon it. It is significant of what may be expected in the near future, however, and some makers employing this form of ignition go so far as to predict that another year will see more cars using the storage battery of the lighting system for ignition. On the other hand it is pointed out that the magneto manufacturer has attained a high degree of perfection and that the instrument gives perfect satisfaction with a minimum amount of care. Double ignition is still favored by several makers and dual double is found on about 2 per cent. of the cars.

In the driving of the magneto some makers have discarded the Oldham coupling and utilize a leather member, instances being noted in the new Chevrolet car and on the Pierce-Arrow. Quietness is assured through this construction.

In the redesigning of the motor and especially is it noticeable of newer productions, compactness and accessibility have been considered. Viewed from the owner's or repairman's stand-

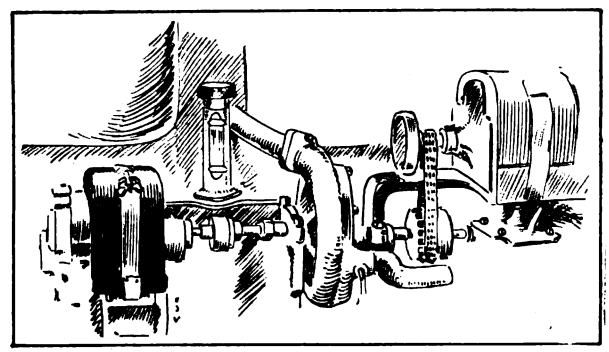


The Oil Filler and Calibrated Gauge on the Marion Is Indicative of the Tendency of the Manufacturer to Provide for Proper Lubrication.

Digitized by Google

point the parts requiring attention after considerable service are far more accessible than was true in former years. In many designs provision is made for adjusting the bearings through large openings, these being secured through ample sized inspection plates at the side, some of which extend the entire length of the cylinders. The Rambler, Herreshoff and several other makes have catered to the owner in this respect. In the American provision is made for the adjustment of bearings, etc., by a hinged arrangement of the cylinders and upper crankcase.

The Imperial motor presents an interesting construction in that the valves are very accessible. The cylinders are cast in pairs and each unit has a plate which is retained by seven studs, and a heavy brass and asbestos gasket is used between the plate and the cylinder. This eliminates the utilization of separate valve caps and facilitates the work of removing carbon and grinding in the valves. The valves are also noticeable for their large size.

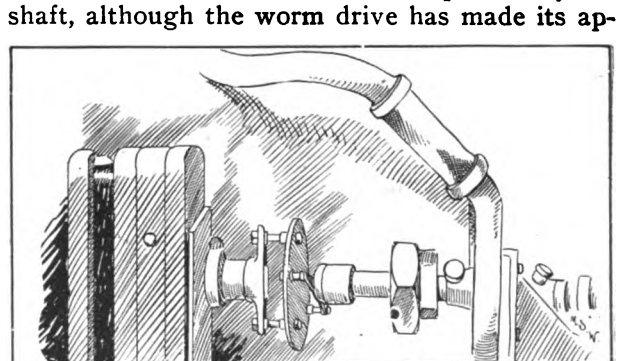


The Exhaust Manifold of the Stoddard-Dayton Is Divided and Secured by a Form of Union or Coupling.

The mounting of the radiator appeals to the repairman as well as the owner, and the use of trunnions instead of bolts integral with the cooler not only simplifies the work of removal and replacement when overhauling the power plant, but prevents damage to the cooler. A departure from conventional practise in the matter of radiation is noted in the Bergdoll, which employs a hood to concentrate the air, a construction adopted because the power plant has been located at a greater distance from the fan than formerly. In the matter of adjusting the tension of the fan belt one maker uses a spring.

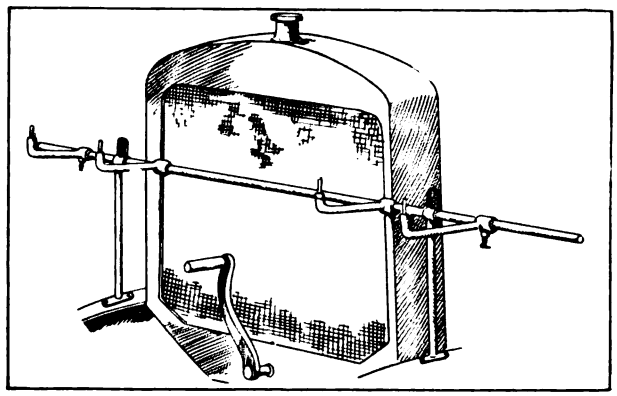
Clutches and Transmission.

The count of cars on display indicated that the cone type of clutch is still in the lead, 157 models having this form, or about 48 per cent. The multiple disc has gained slightly, 143 machines, representing 40 makers, one less than with the cone, favoring this construction. Two makers displayed friction, while three showed a special form or construction of clutch.



Showing the Method of Driving Magneto, Pump and Lighting Dynamo on the Abbott-Detroit.

In the matter of transmissions the selective is fitted to 98 per cent. of the cars, 81 makers showing this construction, while but two employ the progressive type and a like number the friction. In the location of the gearbox it was noticeable that of the three positions, a unit with the motor, mounted separately in the centre of the chassis and as a unit with the rear axle, the first named has gained a large number of advocates over last year. The number of centre installations is falling off, while the rear axle method appears to be holding its own.



Four-Speed vs. Three.

In view of the controversy among engineers as to the respective merits of the three versus four-speed transmission, it is interesting to note that the figures of the industry show that the four-speed has gained about 22 per cent. during the past year. The show figures, however, reveal the fact that of the 329 models 220 were fitted with three-speed gearsets, these representing 61 makes or about 63 per cent. That there is a growing tendency to fit the four-speed transmission is noted when it is taken into consideration that 100 cars, representing 27 different makes installed the four-speed transmission. Insofar as drive is considered it is practically all shaft, although the worm drive has made its ap-

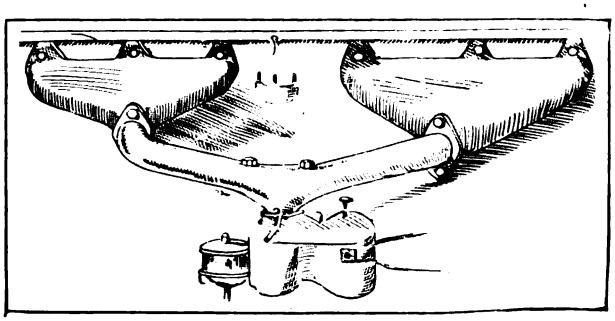
Digitized by Google

The R-C-H Makes Use of a Horizontal Rod for Eliminating Vibration of the Lamps and for Supporting the Lamp Brackets.

pearance with the Edwards-Knight, and the Cartercar and Metz friction driven machines employ chains, the former one and the latter two.

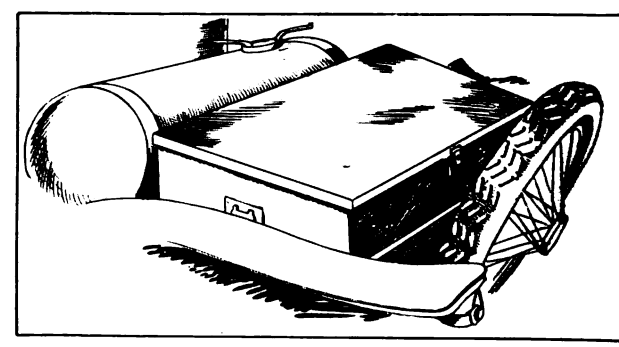


Full Floating Axles.

The makers utilizing the full floating type of rear axle have grown in numbers and 219 cars, representing 69 makers, or 63 per cent. of those displayed, were fitted with this construction. The semi-floating design is second with 22 makes, representing 62 models, while 12 machines employ the three-quarter and one the tubular dead type.

The front springs are semi-elliptic, 83 makers using this form, while but three employ full elliptic. In the matter of rear springs the three-quarter elliptic has grown steadily in favor, 56 makers, representing 213 cars, or 65 per cent., favoring this method of suspension. The semi-elliptic is second with 11 makes with full elliptic a close third. The platform is still indorsed by six makers, 23 models thus equipped being shown, while the three-quarter platform has but two advocates.

Rims and Wheels.



Wire wheels made their appearance, being shown on the following cars: Stutz, Henderson, Edwards-Knight, Stevens-Duryea, Premier, Haynes, Buffalo Electric, Keeton, Kline, Pathfinder and Fiat. And it is noticeable that several makers list wire wheels as optional or extra. According to one convert to the wire wheel, whose cars have been very successful during the past racing season, they make for greater tire mileage in that the shoes do not heat as readily as with other forms of rims when the car is driven at high speeds. This deduction is not theoretical as the engineering force of the company conducted a number of experiments to determine the efficiency of the construction.

Showing the Two-Part Intake Manifold of the Stoddard-Dayton, Which Differs from Conventional Practise.

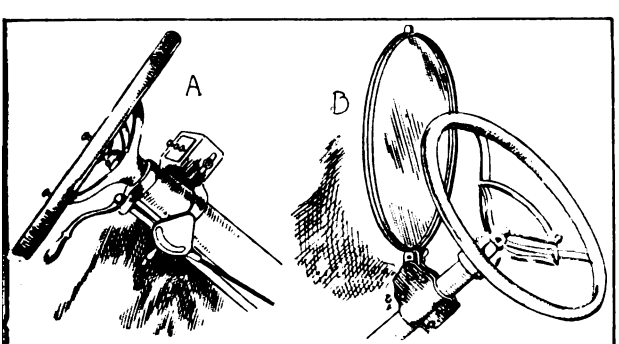
Demountable rims are now standard equipment and the increase in users of these is several hundred per cent. over last year. Of the 329 machines listed at the show, 273 were equipped with quick detachable, demountable, or about 83 per cent., and 33 with demountable, while but two makers employ the quick detachable rim and four the plain clincher.

That locating the steering wheel at the left is gaining adherents is demonstrated by the increasing number over last year. While the right hand steer leads, 52 makers retaining this form, or about 63 per cent., 93 machines have the left hand steer or about 29 per cent. When the number of makes, 33, favoring this location is taken into consideration against 52 with the right hand wheel, the increase of the former is marked in comparison. The argument that the mounting of the wheel at the left would be confined to low and medium priced motor cars has been exploded by placing the driver at the left in many of the high priced machines.

Tools and Spares Are Carried in Compartments in a Special Box at the Rear of the Fiat Roadster, Making for Accessibility and Convenience.

Centre Control Gaining Ground.

Centre control also has gained many advocates during the past year and of 329 models it was noted that but 185 placed the levers at the right of the car, or about 56 per cent. Centre location is favored by 43 makers, representing 128 models, or about 39 per cent. Three list the

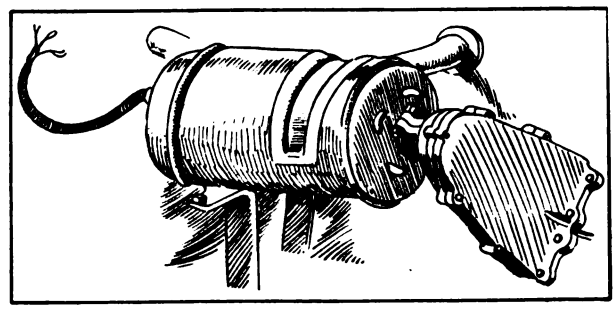


Digitized by Google

control as optional while two place the levers at the left.

Very little variation in frame construction was shown, the conventional dropped frame being prominent, but a slight gain in the use of the double drop is noted. The low centre of gravity has been secured in many designs by clipping or underslinging the springs beneath instead of on top of the axle. Wheelbase remains about the same and it is noticeable that many concerns are fitting some form of shock absorber. Many makers who did not equip the car have joined the ranks of those offering complete equipment even to the extent of supplying a lighting and motor starting system.

Electric Lighting Popular.

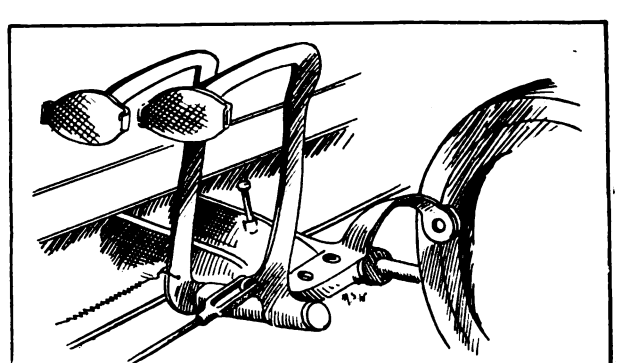


Although a number of makers equipped their product with some form of electric lighting last season this form of illumination has gained the approval of the motorists more rapidly than have the motor starters. That electric lighting will

Refinements in Construction: A, The Lighting Switch and Controls of the Schacht Are Mounted on the Steering Column in a Neat Metal Box—The Handle Being Utilized to Operate the Motor Starter; B, Showing the Miniature, Individual, Adjustable Windshield on the Pathfinder Cruiser.

eventually become universal is indicated by the statistics of the show, these showing that of the 329 models, 293 were lighted by electricity and 22 by acetylene, while seven are listed with the electric as optional. The total number of makers favoring the popular form of illumination was 78, or about 89 per cent., while 11 makers retain the older form, gas, and two leave the decision to the judgment of the buyer.

One of the interesting features of the lighting situation is that many manufacturers of popular priced machines who have joined the ranks of the electrics, now give the dynamo or generator type of equipment. That the maker of the low priced machine desires to cater to the demand for electric lighting is shown by several fitting large capacity storage batteries and electric lamps.



Illustrating the Method of Enclosing the Silent Chain Driving the Generator on the Velie.

The general adoption of the mechanical generator of current for lighting has influenced the design of the new motors to a certain extent and many of the new power plants mount the dynamo in such manner as to completely enclose the drive, a construction making for quiet operation and durability. Many manufacturers who have added the generator utilize special brackets and take the drive from the shaft actuating the pump and magneto. Chain, shaft and belt are utilized, depending upon the design of the motor and convenience of installation.

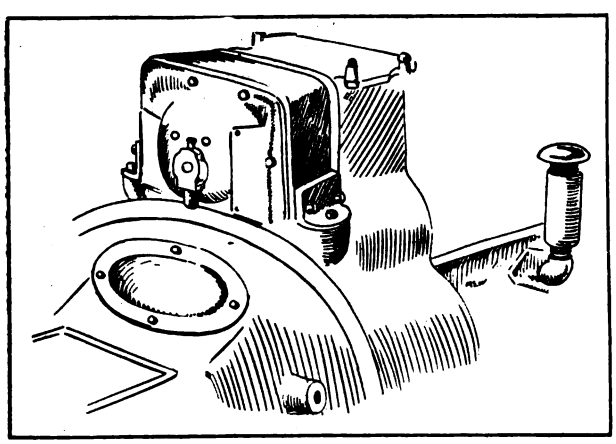
Differing Methods of Drive.

An example of grouping the magneto, pump and dynamo was shown on the Abbott-Detroit. The dynamo is mounted upon a special bracket and driven by a pulley on the extension of the camshaft, and the same shaft actuates the pump and the magneto.

The influence of the electric lighting equipment upon the design of new sixes is noted in the Auburn, the motor of which is noticeable for the clean sides and the mounting of the magneto, pump and generator. Transverse drive is employed to actuate the pump, which is forward of the cylinders and the same shaft drives the magneto. The dynamo is mounted forward, at the left, and is positively driven. The oil filler and tell tale member are also located at the front

An Adjustable Clutch Stop or Brake Is Fitted to the Michigan, Making Shifting of Gears an Easy Matter.

Digitized by Google



of the motor, a construction not only making for accessibility, but a clean appearing power plant.

An example of the enclosed chain drive of the generator was shown by the Velie and a feature of the construction was compactness. The design also makes for accessibility.

Lighting Controls.

Many refinements of the control for the lighting system were noticeable and two makers have adopted the steering column location of these members, as well as those of the motor starter. The Packard system was described and illustrated in the last issue of The Automobile Journal.

The Schacht control box attracted considerable attention not only because of its being convenient to the driver, but due to its compactness and neat appearance. It comprises a small, highly polished aluminum box located on the steering column under the wheel. The control device

The Electric Motor Starter Is Mounted Over the Flywheel and Completely Housed on the Herreshoff Power Plant.

contains the push buttons, permitting of the lighting of any group of lights, also that operating the electric horn. Behind the column and under the wheel is fitted the handle or lever actuating the electric motor starter. By moving the lever the current is cut-in to the electric motor, which revolves the flywheel of the engine.

This locating of the lighting and other controls on the steering column and convenient to the driver, will doubtless be adopted by other makers next season, as the tendency in refinements, as noted, appears to be to eliminate as much as possible any exertion upon the part of the driver.

Motor Starters Mostly Electric.

The growth of electric motor starters has been remarkable during the past year and figures show that 220 machines, or about 64 per cent., have electric units. This is in decided contrast to 1912, when about 2 per cent. utilized electricity. All of the makers do not indorse the electric motor, however, and in some instances the highest priced American cars favor the compressed air starter. Six makers pin their faith to this installation and these showed 27 models, or about 8 per cent. The acetylene starter has lost considerable ground, but it was noted that eight makers employ the gas starter, which was installed on about 20 cars. But one mechanical starter was exhibited. Some manufacturers, believing that the problem of motor starter is best solved by the purchaser, offer option of gas or electric.

Flywheel Drive Favored.

In the matter of utilizing the electric motor starter, that is, applying its energy for rotating the crankshaft of the gasoline engine, the original method of cutting teeth upon the periphery of the flywheel and revolving the latter by means of a gear on the armature shaft of the electric motor has many followers. The majority employ this installation, although a few adopt different methods.

The most common installation is to mount the electric motor so that its driving gear may be slid into mesh with that on the flywheel, and the electric unit is both installed back and front of the flywheel. Many are not enclosed, but a few makers have provided housings, examples being noted in the Pathfinder and Herreshoff. These place the motor over the casing housing the flywheel and clutch.

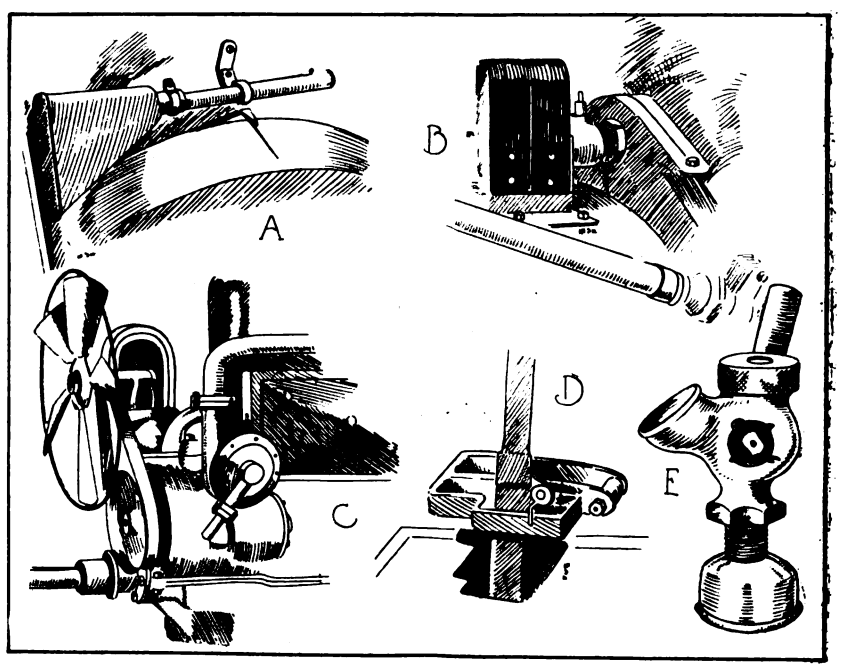
Combined lighting and motor starting units were shown on several cars, including one design which replaces the usual flywheel of the engine. The new Inter-State six-cylinder mounts a combined motor starter and dynamo, and the design of the power plant favors compactness in installation. The electric unit is mounted on a special bracket integral with the upper crankcase and parallel to it. The extension of the armature shaft carrying the driving member is directly over the flywheel and protected by a removable housing. Operating in a bath of lubricant, wear is reduced to a minimum.

The control box of the Inter-State lighting and starting system is noticeable for its compactness. It is located conveniently to the driver and provision is made in the lighting switch for dimming the lamps when meeting approaching vehicles.

The mounting of the electric starter was not alone confined to the flywheel, it being in some instances installed on the transmission housing and by providing an extra gear energy is im-

Digitized by Google

parted to the layshaft of the transmission, thence by the constant mesh gears to the clutch shaft. A method of mounting the starter transversely in front of the radiator and rotating the crankshaft of the engine was shown by the Hartford Suspension Company, which concern displayed the starter mounted upon the transmission of the same chassis.



A variation of the air starter was noted on the new Chevrolet car, designed by the well known racing driver. Instead of conveying air at pressure through tubes to the cylinders, the Chevrolet energizes a shaft which carries a gear loosely mounted and which is slid into engagement with the flywheel of the motor in a manner similar to that of meshing gears in the change speed box. The end of the shaft is provided with a clutch dog and the engaging gear is fitted with a similar member. When the gear is moved into engagement the dog members mesh, and upon the application of power the flywheel is rotated. In the event of a back fire or reverse movement of the flywheel the gear is thrown out of mesh automatically and in approximately the same manner as that of the starting crank of the motor when the latter is actuated by hand and a back fire takes place.

The subject of body designs is treated elsewhere in this issue. It is noticeable that provision is made by the majority of the manufacturers for their removal without removing or disconnecting a multiplicity of piping, wires, etc. With the majority of the control members located upon the dash and with the latter practically a unit with the chassis, the work of removing the body for the overhaul is greatly simplified. The utilization of the cowled dash for the fuel tank also eliminates the work of disconnecting unions where gravity feed is employed and the removing of accessories from the running boards is appreciated by the repairman who formerly was obliged to displace and store these members.

Economy of Upkeep.

It may be said that the 1913 automobile can be maintained much more cheaply than previous models for several reasons. In the first place the designer has taken into consideration that in time bearings and parts will require adjustment and has provided means for reaching them without pulling down the motor as was formerly the case.

In the matter of convenience it was noted that several manufacturers have made provision for plugging in a trouble or inspection lamp by fitting the dash or other convenient unit with means for making the connection. By providing a suitable length of flexible cord and a socket the owner is enabled to secure ample light when making a minor adjustment to the power plant. The lamps also are of service in making changes of tires or searching for articles in the tonneau or tool box. Locking devices to prevent tampering with or theft of the car made their appearance, and while the majority comprise means for cutting out the ignition, several makers provide for locking the gear shift lever in neutral, etc.

Other Construction Details: A, Hot Air Horn for Warming Mixture on Pierce-Arrow; B, Showing Method of Driving Magneto on Hupmobile; C, Transverse Drive for Magneto and Pump on Auburn; D, Gear Lever Locking Device on Chalmers; E, Garford Priming and Inspection Cup.

The clutches and transmission are more accessible and in many designs the entire rear system may be removed easily and in very quick time when compared to the older types of machines. The manufacturer has given attention to many small details of construction and all of these minor improvements mean as much to the repairman as the owner. They make possible the completion of the work in quicker time and economy in upkeep is assured the owner by accessibility of the parts.

Digitized by Google

PROMINENT ACCESSORY DISPLAYS IN DETAIL.

Brief Description of New and Standard Supplies, Parts and Fittings Exhibited at New York Show by Some of the Best Known Producers in the Industry.

Allen Wrench & Tool Company, Providence, R. I.—The principal feature of this exhibit was the Allen friction wrench set, comprising a large number of sockets for all classes of work and a wrench which provides an instantaneous grip and permits no lost motion. This is not a ratchet device, the grip being secured through a patented application of the friction principle. In addition to the regular set a wrench having many of the same characteristics, but of less expensive material, also was shown as well as the new Allen friction drill.

Automobile Supply Manufacturing Company, Brooklyn, N. Y.—Four types of the Newtone electric horn, Torpedo, Superior, M and N, were shown by this company. It is maintained that the motors used in these products are of superior design and construction, the shafts running on ball bearings, a feature which makes for the elimination of oiling and adjustment. The Superior is the newest model and is produced to sell at a popular price.

Baldwin Chain & Manufacturing Company, Worcester, Mass.—This concern presented a full line of its power transmission chains for automobile and motorcycle service, these including detachable double roller and block types. The company also manufactures sprockets for these chains, and examples of special work in this line for commercial vehicles were shown.

Brown Company, Syracuse, N. Y.—Of chief interest at this exhibit was the Brown impulse tire pump, which operates on the compound principle, inflating the tire with pure cool air, although made for attachment to the motor. Tire pressure indicators and testers, compressometers, valve grinding sets, spark plug wrenches, headlight deflectors, quick detachable spark plugs and gasoline vulcanizers also were shown.

Coes Wrench Company, Worcester, Mass.—Inasmuch as the Coes wrench was invented in 1843, and the company has been making tools of this character for the automobile trade since the inception of the industry, the line is well established. The display consisted of all types, from the smallest to the largest, some of the latter being 48 inches in length. Particular attention was drawn to the steel handled type, some of these being shown in section to indicate the internal support of the steel shell.

Columbia Lubricants Company of N. Y., New York City—At this booth were displayed the several grades of Monogram oils and greases made especially for automobile uses. The oils range from light to very heavy and are carefully refined to produce the results best adapted to the particular motor for which they are prepared. They are marketed in special sealed cans which guarantee that they shall reach the purchaser in their original condition. The company also makes a special grease for gearcases and differentials.

Corbin Screw Corporation, New Britain, Conn.—The new Corbin-Brown speedometer for automobiles and motorcycles was shown for the first time at this booth. These instruments are controlled by the centrifugal governor principle, and the arrangement of the indicator is such as to afford a steady reading under all speeds. That designed for automobile use will record mileage up to and including 100,000 miles.

Smalley Daniels, Detroit—Of particularly timely interest was the new safety pedal lock shown by this exhibitor. This consists of a bar so positioned that when the clutch pedal is pressed forward the bar may be thrown across the space behind it, preventing the use of the car by anyone not possessed of the proper Yale key. A new safety tire lock also was shown and still another feature of the display was a number of vehicle springs for all types of motor vehicles, both pleasure and commercial.

Dean Electric Company, Elyria, O.—While special attention was drawn to the Dynalux electric motor starter and lighting system produced by this concern, because of the importance of such equipment in this show, quite as much interest attached to the Hi-Fre-Co magneto, so named because of its high frequency spark, for which special advantages are claimed. The new Elyria-Dean speedometer occupied a prominent place in the exhibit, which also included the well known Tuto and Rexo electric horns.

Joseph Dixon Crucible Company, Jersey City, N. J.—A feature of this exhibit was the demonstration in charge of Dudley Thurston, showing the action of Dixon's graphite lubricants in the transmission and differential gears. Special attention was drawn to motor graphite, graphite fibre grease, graphitoleo and graphite cup grease. The particular advantages of this method of lubrication was brought out in an interesting manner, and mention also was made of the use of powdered graphite for tires and rims.

Dover Stamping & Manufacturing Company, Cambridge, Mass.—A full line of equipment for the private or public garage was shown by this concern, including drip pans, funnels, cans, boxes, etc. Of timely interest, because of the increasing price of motor fuel and the necessity for providing against waste, was the new Dover Saval combination measure and funnel. This is equipped with an automatic shut-off attachment in the form of a ball, which is held upon its seat and prevents the flow of lubricant until a suitable push button is operated. The Dover soap economizer, which fits in the bottom of the washing pail, also was displayed.

Electric Storage Battery Company, Philadelphia, Penn.—The centre of interest at this display was the demonstration of lighting and starting batteries. A full line of cells and trays for the Exide, Hycap-Exide and Ironclad-Exide batteries also was shown. During the second week special attention was drawn to the types of batteries designed and constructed for commercial vehicle work.

Firestone Tire & Rubber Company, Akron, O.—This concern called special attention to its non-skid tread, in which the word "Non-Skid" is raised to form the blocks providing against skidding tendencies. A new cushion tire for electrics also was presented, this being of the dual smooth tread type. Firestone quick detachable, demountable rims, red inner tubes and repair materials formed a portion of the display.

Fisk Rubber Company, Chicopee Falls, Mass.—In Fisk shoes, special emphasis was laid upon the Dunlop type, and it was stated that all Fisk tires were oversize. The Fisk red inner tube and the new Fisk gold bond tube, which is accompanied by a liberal guarantee, also were featured. Additional products of this concern to which attention were drawn were the Fisk removable rim, repair shop equipment and repair materials.

Gabriel Horn Manufacturing Company, Cleveland, O.—A very comprehensive demonstration of the Gabriel rebound snubber was the feature at this display. A miniature automobile, containing two small figures, was so arranged that when the snubber was brought into action the effect upon the mechanism of the car was decidedly apparent. The Gabriel horns and windshield cleaner also were shown.

B. F. Goodrich Company, Akron, O.—The Goodrich Safety tread, comprising a series of straight bars running longitudinally and crosswise of the tread, was the central feature of this display, although attention was drawn to the new Goodrich cord tire for electrics, for which decided mileage capacity is claimed. With this the principle of construction, which entirely replaces fabric by a duplex cord foundation, is held to be such that all special stresses inherent to the electric form of propulsion are equally distributed over the whole circumference of the tire, thus reducing frictional heat to a minimum.

Goodyear Tire & Rubber Company, Akron, O.—This company had a demonstration of the double cure process used in the manufacturing of Goodyear No-Rim-Cut tires, which were exhibited with and without the non-skid treads. Notable in the Goodyear display was the tire accessory line, which was presented in two showcases, a duplicate of those offered to dealers the first of the year. Aeroplane tires and motor clothing also had a place in

Digitized by Google

the exhibit, and free air was furnished to car exhibitors, Goodyear air bottles being delivered daily for this purpose.

Gray & Davis, Boston, Mass.—This display included the usual comprehensive line of Gray & Davis electric, gas, gas-electric and oil lamps, among which were a number of specially finished and ornamental designs for enclosed cars, etc. The Gray & Davis dynamo was demonstrated on a handsome plate glass and mahogany stand, resembling the dash of an automobile, this method being taken to indicate the efficiency of the company's electric lighting system. The Gray & Davis six-volt electric starter occupied the centre of the booth.

Gray Specialty Company, Newark, N. J.—This display included a full line of no-cement patches, cements, tool boxes, tire paints, vulcanizers and other tire sundries. Particular attention was called to a new form of blow-out patch termed the Avon. This is from 12 to 14 inches long and is built up of seven-ply woven cloth, and when this is properly applied it is maintained that it will hold any blow-out which is not too long for the patch.

Hartford Suspension Company, Jersey City, N. J.—Although the Hartford electric starter and lighting system was shown for the first time last year, it easily was the centre of attraction at this booth again at this show. In the Grand Central Palace two of these were fitted to a stripped chassis, illustrating the adaptability of the starter when located in different positions. Naturally, the Truffault-Hartford shock absorber, which is by all means too well known to need extended description, was not forgotten, and the Hartford jack and Hartford bumper also were presented.

A. W. Harris Oil Company, Providence, R. I.—Harris oils were demonstrated in a satisfactory manner at this booth, an engine, transmission and differential being arranged as they appear in the automobile, all working with the proper grade of lubricant. Harris oils are made in three consistencies, heavy, medium and light, and are refined from the very best Pennsylvania crude. Other products by the same company are trans-compound, a heavy dark colored oil reduced to grease consistency; transmission grease, light colored; gear and transmission oil; superheated steam cylinder oil and motor and graphite greases.

Havoline Oil Company, New York City—This company featured the Havoline white oil, a demonstration being made of the filtering process utilized in refining high grade automobile cylinder oils. A new form of container of two and five-gallon cans was shown, this having been adopted for the purpose of cutting down the cost to the consumer, and permitting him to make purchases of small lots at close to the barrel price.

George A. Hawa, New York City—Panhard oils were displayed at this booth. The maker holds that the line has been in the market so long and covers the lubricating requirements of an engine so thoroughly that it has not been found necessary to make any changes or additions to the products manufactured by it. Samples of the various oils and greases, sold under the Panhard name, were exhibited in an attractive form.

Hawthorne Manufacturing Company, Bridgeport, Conn.—The centre of interest at this exhibit was the Hawthorne four-cylinder air pump, which operates by hand and is of the continuous discharge type, being actuated by a hand crank and in one direction. The pump is small in size and may be clamped to the running board. In addition a full line of Old Sol lamps and generators was presented.

Heinze Electric Company, Lowell, Mass.—Augmenting the line of magnetos, coils, timers and switches manufactured by this concern, several spark plugs of interesting design and construction were shown. Among these was a new priming spark plug, which is held to make easy the cranking of the motor even in the coldest weather. The plug itself is made of mica and is guaranteed against leaking compression. The priming feature is incorporated at the top, the gasoline being conveyed to the sparking points.

Herz & Co., New York City—Two new magnetos have been added to this line, one of these being for motorcycle use. The Herz magneto is now constructed with double U shaped magnets, one being arranged to fit over the other, and provision is made for the use of aluminum side plates making a water and dust proof joint. Spark plugs, timers and other ignition supplies also were shown.

Hoffecker Company, Boston, Mass.—The manufacturer of the Hoffecker steady hand speedometer called attention to this feature, as well as the addition of the daily trip register, which can be set quickly to give intermediate readings and for any desired mileages, and the instantaneous resetting mechanism designating fractions of a mile, which has been made for the 1913 season. The speedometer is supplied either with or without a clock combination, and in the latter instance the clock is the product of the Waltham Watch Company, Waltham, Mass.

International Metal Polish Company, Indianapolis, Ind.—The well known line of Blue Ribbon polishes, which has been a standard for the past eight years, was shown at this booth. Blue Ribbon cream metal polish is held to be ready for instant use at all times without shaking, as it is an emulsion, and to leave no sediment in crevices. The company also displayed the Blue Ribbon greaseless cream, a polish and body gloss for automobiles.

Janney, Steinmetz & Co., Philadelphia—Particular attention was called to the seamless cold drawn steel tinned and tested gasoline tanks made by this concern. These are designed and constructed for automobile and motor boat use and are held to be an absolute protection against leaks. Special tanks are made to accommodate any design of pleasure car or truck. The company also makes tanks for compressed air, indicators, brass fittings, etc.

J. M. Shock Absorber Company, Philadelphia—Four models of the J. M. shock absorber were displayed at this booth, with a demonstration fitted to show the effect upon the car and its occupants when utilizing and not utilizing the equipment. Model A is of the twin type and is held to be adaptable for most cars, this being made in three sizes for cars of differing weights. Model B is for application to the rear of cars with full elliptic springs, model C for cars with single springs, the ends of which are attached to rigid hangers directly connected to the chassis, and model F for Ford cars.

Marburg Bros., Inc., New York City—While the well known Mea magneto occupied the central position at the Garden display by this concern, the Lucifer electric lighting equipment for motorcycles, described in detail elsewhere, was prominent at its booth in the Palace, which was located adjacent to the motorcycle section. Marburg-Hagen springs, S. R. O. ball bearings, and other imported goods made up the balance of the exhibit.

Chas. E. Miller, New York City—Because of the position of this house as the pioneer accessory concern in America, the line exhibited both in the Garden and in the Palace was decidedly complete in every respect. Catalogues, calling attention to the various products handled at the main office, 97-103 Reade street, New York City, and the 16 stores in eight different states, were distributed to all who visited the display. The A. B. light and the new Miller spark plug are mentioned in detail elsewhere in this issue. Another feature of the display was the spring leaf lubricator, a device intended to make easy the work of lubricating the springs of an automobile by spreading the leaves. Miller's Pan-American lubricants, imported Brampton chains, Glengarry robes, Wauto pails and a new line of chemicals for motor car uses were among the accessories and fittings at the Miller display.

A. R. Mosler & Co., Mt. Vernon, N. Y.—Of course the Mosler Spit Fire line of spark plugs was displayed at this booth, special attention being called to the Spit Fire breech block type—the plug with a handle. It is maintained that the base of this plug acts as a condenser of electricity and forms a compression chamber, economizing current and facilitating sparking. The Mosler, Jr., a new plug of the ordinary type, as distinguished from the magneto type, also was shown. Another addition to the line carried by this concern is the Mt. Vernon oil gauge for Ford cars. The Mosler gasoline separator, a device making for efficient carburetion and at the same time protecting the car against theft, also was exhibited.

Frank Mossberg Company, Attleboro, Mass.—A full line of wrenches and tools for automobile work was shown by this company, the chief feature being the Mossberg socket set No. 14. This is claimed to be the largest and most complete socket wrench set yet produced, and contains handles for every kind of difficult approach and sockets to fit all sizes from .3125 inch to 1.14 inches.

Motz Tire & Rubber Company, Akron, O.—Special attention was directed to the Motz cushion tires for electric and gasoline pleasure cars and trucks. As is more or less well known these tires have double treads, undercut sides, slantwise bridges and non-skid indentations. It is maintained that the double treads distribute

Digitized by Google

the weight properly over the sides and prevent skidding in a noticeable degree; that the undercut sides allow free action of the bridges, which when in action have a stretching effect, affording resiliency equal to the pneumatic tire, and that the non-skid indentations are deep enough to permit ample displacement of the rubber when passing over obstacles. The result claimed is additional mileage, with the resiliency of the pneumatic.

National Rubber Company, St. Louis, Mo.—One or two new lines have been added by this company. Narco is a non-inflammable rubber cement, pure white in color, which is designed to be used as a tire cut filler, and it is maintained that small punctures and cuts can be treated without the necessity for vulcanizing, the material drying over night. Reviver Refinisher is a varnish for water proofing tops and renovating all rubber goods. Tirenew, an original product of this concern, is intended to act as a preserver against moisture, and to improve the appearance of the shoe.

New Departure Manufacturing Company, Bristol, Conn.—This company presented a very full line of its ball bearings in both double and single row types, and in all standard sizes. The double row bearings are designed to take care of combined radial and thrust loads, while the single row members are strictly radial. Still another type, termed the Radax, is for radial and one direction thrust. Special care is taken in the selection of material and in the manufacture of the product, each bearing being subjected to 31 different inspections while passing through the plant.

New York & New Jersey Lubricant Company, New York City—It is maintained that this company was one of the pioneer exhibitors at motor car shows. This year Non-Fluid oils were demonstrated in a most attractive manner in a transmission gearcase and differential. A unique device was employed to display the various grades of the concern's cylinder oil—Motorol. The Kejex package is held to obviate the necessity for using a grease gun, inasmuch as the can is supplied with a long spout, and a key in the bottom is made to expel the lubricant as desired. This package is designed for applying K No 000 grade Non-Fluid oil to all parts of the car requiring a medium bodied lubricant.

Perfection Spring Company, Cleveland, O.—The full line of Krupp steel springs made by this concern for both pleasure and commercial cars, was arranged so as to display the very efficient qualities of the product. Special constructions are offered to meet the individual requirements of the manufacturer, this applying particularly to the maker of motor trucks and business wagons.

Philadelphia Storage Battery Company, Philadelphia—Not only did this company display its batteries and the various parts entering into their construction, but several unique features as well. On either side of the exhibit was a lamp, composed entirely of battery parts. Near the centre of the booth was a table with a glass top under which were a number of blue prints showing the efficiency and increase of life of the battery due, as it is maintained, to the use of the thin plate type. The whole idea was to convey a large amount of educational information in a short time.

Randall-Faichney Company, Boston, Mass.—The well known Jericho and Jubilee exhaust horns, made by this company, occupied a prominent place in the exhibit. Muffler cut-outs, B line grease guns, Blitz spark plugs, Jericho gas regulators, Webster tank gauges and other sundries, made up the balance of the display.

Remy Electric Company, Anderson, Ind.—In view of the general interest in electric lighting systems during this show the Remy lighting dynamo, made by this company, was called to the attention of visitors. A full line of Remy magnetos, including the new model RD perfected inductor type, also was shown. For this it is claimed that it is small, compact and light in weight. It is of the two-magnet type and the magnets are made from tungsten steel of high quality.

Republic Rubber Company, Youngstown, O.—The Staggard tread tires were shown by this company, among them being a pneumatic shoe for electric machines, incorporating the same features which have made the gasoline vehicle tire so largely in demand. For the second week the Republic steel base wireless motor truck tires were featured, these being supplied in single and dual tread types.

R. I. V. Company, New York City—A large assortment of the imported R. I. V. bearings was presented by this exhibitor. These are held to incorporate a number of new ideas in ball bearing construction, some of which are of the combined radial and thrust type, and others of the self-aligning type. The Vincon machine was a portion of the display, this being an instrument intended to show the relative friction resistance between the annular bearing and the best types of bronze bearings.

Ross Gear & Tool Company, Lafayette, Ind.—A full line of steering gears for pleasure cars and trucks was displayed by this company in both buildings and for both weeks. Differentials and bevel gears also were shown. During the second week particular attention was drawn to the steering gears for commercial vehicles, in which this company is conceded to be a specialist. All standard designs are made, as well as special designs to meet the individual requirements of the manufacturer.

Royal Equipment Company, Bridgeport, Conn.—While the opportunity was not lost by this concern to call attention to the merits of the Duplex and Raymond brakes for both pleasure and commercial vehicles, special emphasis was laid upon Raybestos, a friction facing for brake bands, multiple disc clutch rings and cone clutches. This product is almost too well known to need extended description. Gyrex the Mixer, a device for securing greater efficiency from gasoline, also was displayed by this company.

J. H. Sager Company, Rochester, N. Y.—This year the display made by this concern was largely one of bumpers, over 40 different designs being presented, to meet the requirements of differing makes of cars. The Sager equalizing springs also were shown and demonstrated. Particular attention is paid to the manufacture of the bumpers, which are held to be used in large numbers on the highest grades of cars. They are distinctive in design and it is maintained that they are easily attached, this being a matter of only a very few minutes' work.

Simms Magneto Company, New York City—Several types of the American Simms magnetos were shown by this concern, included among which are the single and dual forms. The Independent type S. U. 4 has base and end plates of heavy bronze, and all matched surfaces are machine finished. The armature is mounted on imported annular ball bearings. In general construction the dual magneto is the same as the Independent, the only differences being in the substitution of a dual contact breaker and the addition of the commutator or battery timer. The American Simms dual switch also was exhibited.

Splitdorf Electrical Company, Newark, N. J.—The Splitfordlite, the new lighting system manufactured by this concern, was shown for the first time at a New York show. This comprises a dynamo that differs from those of usual construction in the method of compensating for the variable speeds of the motor, this being accomplished by the differential windings and a special construction in the arch of the generator. The Splitdorf magnetos also were displayed, the line including the latest models of the well known low-tension type, as well as Splitdorf coils and plugs.

Standard Welding Company, Cleveland, O.—The new standard universal rims, recently brought out by this concern, were displayed, as well as an entirely new design for wire wheels. Careful attention has been paid to the matter of protecting the inner tube by means of a special band, and the exterior of rim—that portion within the wheel proper—has been rolled out on both sides, the object being to prevent the accumulation of mud and water on this portion of the rim. The advantages of electric welding also were called to the attention of visitors.

Standard Woven Fabric Company, Worcester, Mass.—The merits of Multibestos, a brake lining that has met with decided favor on the part of many car manufacturers, including the producers of the Packard, Pierce-Arrow, Alco, Fiat and others, was demonstrated at this booth. Attention also was drawn to the fact that the company is completing the first unit of a new plant, which will enable it to fill orders, which have been increasing rapidly of late, in the quickest possible time.

Stewart-Warner Speedometer Corporation, Chicago—Inasmuch as this concern, which is in effect an amalgation of the Stewart & Clark Manufacturing Company, Chicago, and the Warner Instrument Company, Beloit, Wis., was only recently organized, both constituents made display. At the Warner booth a full line of Warner Auto-Meters was exhibited, these being produced both with and without the clock combination. The new Stewart line is most complete, some of these being furnished in combination with a grade indicator. A new Stewart speedometer for motorcycles also was shown.

Texas Company, New York City—The centre of attraction at this booth, both in the Garden and at the Palace, was the immense star, typical of Texas, the Lone

Digitized by Google

Star State, composed of glass containers filled with the various grades of Texas oils. The different packages in which these lubricants are sold, and for which it is claimed that the construction of the can is such that the customer is insured of receiving the proper quality, also were displayed prominently, in order that they might be most familiar to the purchaser.

United States Tire Company, New York City—Particular attention was drawn by this concern to its straight side or Dunlop tire. The Nobby and Chain anti-skid treads also occupied a prominent place in the exhibit. What was claimed to be the largest standard pneumatic tire in the world, 38 by eight inches, was another feature. A souvenir booklet, containing the various scenes connected with the manufacture of the product, was distributed to visitors at the booth.

Vacuum Oil Company, Rochester, N. Y.—Packages containing Mobiloil lubricants made by this company, were arranged so as to present a neat and attractive appearance. A transmission gearcase was utilized to demonstrate the advantages of the particular grade of lubricant adapted for this purpose. As is well known Vacuum Mobiloils are produced in a number of different grades it being maintained by the company that it is able to fill the requirements of each individual motor. Among the new products shown by this company was Mobilubricant in a mechanical grease package, which is held to protect the contents from dirt, and to make possible its use without waste. A key is arranged at the top of the can in such manner that only the necessary amount of lubricant is forced from the container as desired.

Walpole Rubber Company, Boston, Mass.—Presenting an entirely new line of tires, insofar as the New York show is concerned, this company exhibited its quick detachable, clincher and Bailey non-skid pneumatic tires, and extra quality red tubes, all bearing the Walpole name. The tires are made with a guarantee of 4000 miles actual road service, and also are guaranteed against stone bruise.

Weed Chain Tire Grip Company, New York City—The central figure in this exhibit was a large wheel calling attention to the number of Weed anti-skid tire chains manufactured during a stated period. Special attention was called to the ease with which these members may be attached, and to the safety afforded by their use. A new Weed chain for motorcycle use also was presented. During the second week a truck chain was revealed, this having the same characteristics of the better known type and being particularly adapted for heavy service.

West Side Y. M. C. A., New York City—Because of the part that has been played by this institution in conducting an educational campaign for the benefit of the industry, it was particularly fitting that space should have been reserved for it. The methods employed were revealed in a pleasing manner and visitors were invited to enroll as students. In the centre of the exhibit was a chassis, and effort was made to indicate the manner in which students were taught the details of operation, and care and maintenance.

Willard Storage Battery Company, Cleveland, O.—The maker of the well known LBA lighting batteries exhibited its new motor starting batteries as well. Both are produced in a large number of types to meet the varied requirements of motor car service. Individual unit cells are employed with the Willard pasted type of plates which, with the special alloy grid, make for strength. Special provision is made for preventing the creeping of acid and subsequent corrosion. The LBA batteries are now standard equipment on a large number of cars.

Wolverine Lubricants Company, New York City—The full line of Wolf's Head oils, manufactured by this company for the varying needs of differing types of motors, was shown in the original packages, as well as the motorcycle oils. Crystal oils and greases are made under the same trade mark. A special line of Packard oils also was displayed. The cans and barrels are sealed when they leave the factory, insuring that the purchaser shall receive the proper quality.

INDEPENDENT OVERFLOW SALON.

Attractive Display of Vehicles Unable to Secure Space at Providence Show.

Being unable to secure space at the regular automobile show in the state armory at Providence, R. I., several dealers in that city formed the Motor Car Dealers' Association of Providence, Inc., for the purpose of holding an independent automobile salon in the Narragansett hotel ball room during the progress of the armory display, Jan. 25-Feb. 1. This independent exhibition was in no sense a rival of the other, but was rather in the nature of an overflow proposition.

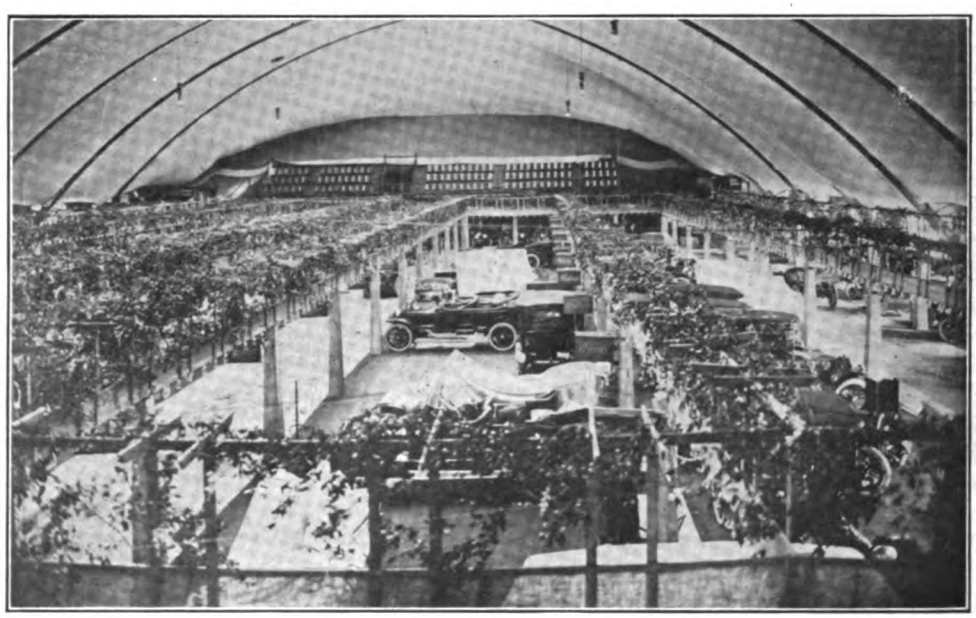
The ball room was attractively decorated with ferns, palms and potted plants, in addition to the beautiful cut flowers grouped about each exhibit. The officials of the association in charge of the show were: President and general manager, H. F. Farrow; vice president, Henry H. Kendall; treasurer, Franklin Nichols; secretary, Robert L. Knight.

Eleven makes of vehicles were represented, including duplicates of the racing cars to be entered in the Vanderbilt and Indianapolis races. These attracted much attention and were the Stutz; Fiat, Mercer and Marmon. Other exhibits follow: J. H. Macalman, Stearns-Knight; Adams & Knight, Mercer; Apperson Company of Rhode Island, Apperson; Dickinson Motor Car Company, Stutz; Capital Motor Car Company, Hupmobile; Marmon Motor Car Company, Marmon; Fiat Motor Sales Company, Fiat; Lozier Motor Company, Lozier.

MERCER'S YEAR BOOK.

Work of Beck Engraving Company Reflects Characteristics of New Series.

Among the many very pleasing catalogues calling attention to the products of various manufacturers in the automobile industry, the year book issued by the Mercer Automobile Company, Trenton, N. J., is particularly appropriate. It is the product of the Beck Engraving Company and the illustrations and typographical work are worthy of special mention.



The reputation gained by Mercer cars in road and track contests during 1912 is reflected in both text and illustrations, scenes depicting some of the most notable events in which Mercers contended with honor being reproduced. The main portion of the book is devoted to a detailed description of the new series with photographs of the cars in settings bringing out their features in a pleasing manner. The various components of the chassis are similarly treated.

SECOND ANNUAL PROVIDENCE SHOW.

RIVALLING in completeness any automobile exhibition ever held in New England, with the exception of the biggest and best Boston display, the second annual show of the Rhode Island Automobile Dealers' Association opened in the State Armory on Cranston street, Providence, R. I., Jan. 25, for one week. The attendance the first evening was such as to tax the capacity of the building, and the number of machines on display was highly gratifying to the committee in charge and Arthur S. Lee, under whose direction the show was staged.

The armory, which provided 38,000 square feet of exhibition space, had undergone a complete transformation and when the doors were thrown open to the public presented a beautiful spectacle decorated in the splendor of a Japanese court, modelled after the Imperial gardens at Tokio. The roof of the building was covered with blue vaulted arches, from which electric lights scintillated in imitation of stars.

Interior of the State Armory, Providence, R. I., Indicting Beauty of Japanese Setting for Second Annual Show.

Native flowers and works of art were transported direct from Japan to be worked into the general transformation scene. The main drill hall contained a profusion of cherry blossoms and chrysanthemums, entwined with laurel around the trellis work which formed the aisles and booths in which the exhibits were shown. Interspersed in the decorations were myriads of colored electric lights, which heightened the brilliant effect by the glow of their soft-tinted shades. The following is a complete list of the exhibitors:

Pleasure Cars—Foss-Hughes Company, Pierce-Arrow; Aetna Bottle & Stopper Company, Buick; E. E. Whipple, R-C-H; Rhode Island Motor Car Company, Pope-Hartford; A. S. Lee Company, Stevens-Duryea; C. H. Goodwin, Studebaker; William Hughes Company, Reo; Packard Motor Car Company, Packard; J. S. Harrington & Co., Paige-Detroit, Flanders; Mitchell Auto Company, Mitchell; Davis Automobile Company, Regal, Chalmers, Winton; L. B. Lorimer, Hudson; John O'Donnell, Premier; Peerless Motor Car Company, Peerless; Herbert E. Bradford, Pilot; Hitchcock-Banks Motor Car Company, Knox; Cadillac Auto Company of Rhode Island, Cadillac; Peleg Brown Company, Oakland, National; Jackson Motor Car Company, Jackson; North End Garage, Case; Baker Electric Company, Baker electric; Stanley Motor Carriage Company, Stanley steamer; Thomas B. Jeffery Company of New England, Rambler; W. E. Kelton, Cutting; Nock Auto Company, Warren; Charles Barre, Lenox; Whitten Motor Vehicle Company, Abbott-Detroit, Herreshoff; Speedwell Company, Speedwell; William E. Cheever & Co., Nyberg; Providence Motor Car Company, Stoddard-Dayton, Velie; Pugh Bros., Palmer-Singer, Marion, American, Overland; Pawtucket Automobile Company, Cole, Garford; A. E. Kay, K-R-I-T; Crane Automobile & Garage Company, Standard electric; Wallace L. Wilcox, Franklin; White Automobile Company, White; John B. Higginson, Henderson; W. B. Hollander, Metz; Frank J. McCaw Company, Alco.

Commercial Vehicles—Peerless Motor Car Company, Peerless; Foss-Hughes Company, Pierce-Arrow; Rhode Island Motor Car Company, Pope-Hartford; William Hughes Company, Reo; Packard Motor Car Company, Packard; Hitchcock-Banks Motor Car Company, Knox, Modern; Davis Automobile Company, Gramm; United States Mill Supply Company, Mercedes, Daimler, Chase, Mais, Palmer-Moore, Brown; B. F. & A. W. Hopkins, Mack, Saurer, Hewitt; P. A. Eddy Machinery Company, Universal; Pugh Bros., Federal; Frank J. McCaw Company, Alco; White Automobile Company, White; Wallace L. Wilcox, Bessemer; Thomas H. Early & Co., Little Giant.

Motorcycles—B. A. Swenson, Indian; H. G. Baxter, Excelsior, Henderson; Elmwood Cyclery, Harley-Davidson; Rhode Island Motor Car Company, Pope.

Miscellaneous—Waite Auto Supply Company, supplies; B. A. Swenson, supplies; Gamwell & Ingraham, automobile insurance; Champion Refining Company, oils, greases and soaps; Wayne Oil & Tank Company, oil tanks and pumps; B. S. Clark, automobile directory; Automobile Journal Publishing Company, The Automobile Journal, The Motor Truck, The Accessory and Garage Journal; Class Journal Publishing Company, Automobile; Wheeler-Morse Corporation, Swinehart tires; A. E. Goodby, supplies; Belcher & Loomis, supplies; Outlet Company, automobile clothing; F. F. Kellogg, supplies; B. B. Steiber, motor.

Digitized by Google

SOCIAL EVENTS DURING SHOW WEEK.

How Some of the Visitors Spent Their Time When Not Busy with the Display—Annual Meetings and Dinners—List of Factory Men at the Hotels.

FOLLOWING a custom which has prevailed in connection with the New York show for a number of years, several events of more than passing interest were held during the exhibition this year. Being national in character the display in Madison Square Garden and Grand Central Palace afforded an opportunity for many of the officials and department heads of the various manufacturing concerns to come in direct personal contact with the field men and dealers. In some instances company dinners were enjoyed, while several of the organizations within the industry held their annual meetings and banquets. Most of these events took place at the conclusion of the day's work at the exhibition spaces and provided an ideal opportunity for renewing old acquaintances and making new ones.

Guests of the Goodyear Tire & Rubber Company at the $40,000,000 Dinner at Rector's During Show Week.

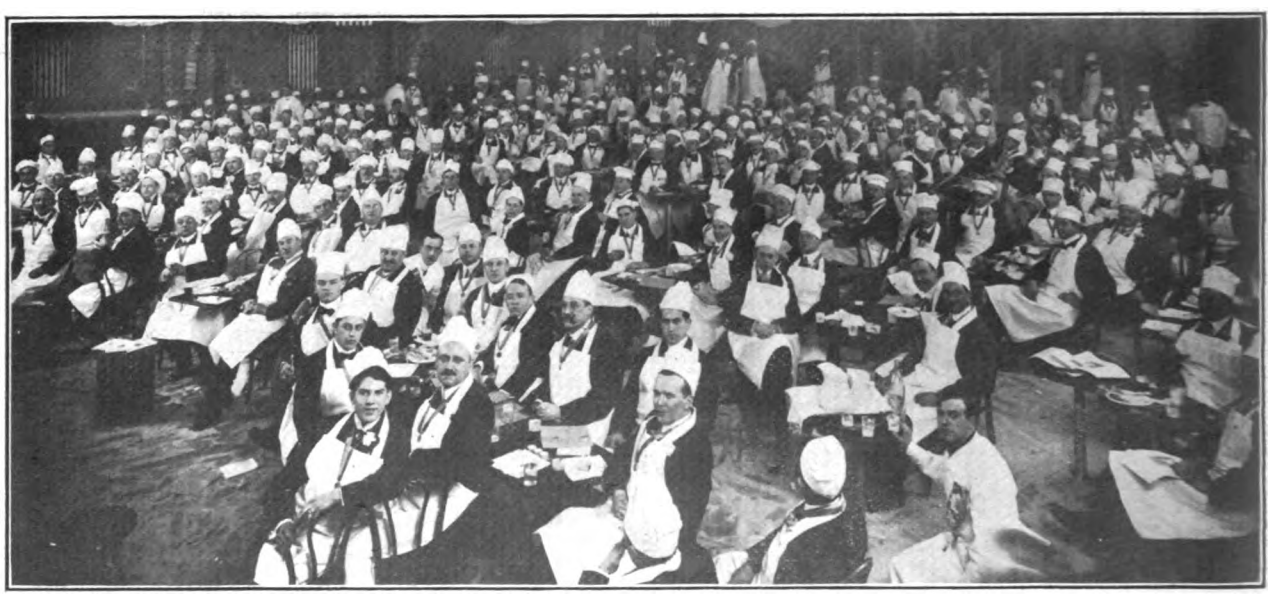
GOODYEAR $40,000,000 DINNER.

One of the most largely attended dinners given by the manufacturers to their branch salesmen and agents was that of the Goodyear Tire & Rubber Company, Akron, O., at the Hotel Astor, Jan. 14. While it was in the nature of an annual event, it was made somewhat different in its aspect by reason of its designation—the Goodyear $40,000,000 dinner. Investigation revealed the fact that this sum had been set by the company as the measure of its business during 1913, and each of the 200 guests wore a ribbon bearing the slogan, "Count on Us."

The occasion was one of good cheer, set off with an elaborate menu. Prominent officers of the company, heads of departments, branch managers and salesmen contributed "words of wisdom from the prophets," under the able leadership of F. A. Seiberling, as seer. Of course there was plenty of music, and much singing of original songs, chief among which was that entitled, "Everybody's Using Them Now."

ACCESSORY MEN AT BANQUET.

Four hundred and fifty members of the Motor & Accessory Manufacturers and their friends sat down to 57 tables in the Waldorf-Astoria, Jan. 15, for the annual banquet of that organization. The event was somewhat unusual, in that the guests were entertained by a cabaret show until time for the post-prandial exercises.



H. T. Dunn, president of the association, presided, although he very shortly turned the gavel over to Howard E. Raymond, a past president, who was programmed as toastmaster. However, after a brief speech, Mr. Raymond delegated these honors to Wilbur D. Nesbitt. President George McAneny of the Borough of Brooklyn was the first speaker, calling attention to the various problems which confront the city govern-

Digitized by Google

ment in the largest city in America. He recalled that Peter Minuit purchased the Island of Manhattan from the Indians for $24, and drew some very interesting lessons from this fact.

W. J. Burns, the famous detective, spoke of the value of organization. He counselled the members of the association to become intimately interested in public questions and to see to it that unfit characters are not permitted to assume public office. Col. George Pope, chairman of the Automobile Board of Trade's show committee, and T. O. McGill, also made brief addresses.

Those seated at the directors' table were: Messrs. Dunn, Raymond, Nesbitt, McAneny, Burns, Pope and McGill, J. H. Foster, C. E. Whitney, F. C. Billings, H. W. Chapin, L. M. Wainwright, D. J. Post, Charles T. Bryne, E. S. Fretz, William H. Crosby, Thomas J. Wetzel, Samuel A. Miles, Merle L. Downs, A. G. Bachelder, H. A. Bonnell, James S. Marvin, Sidney B. Meyers and T. E. A. Barthel.

Members of the Big Village Boosters and Their Guests at the Annual Beefsteak Dinner at Murray Hill Lyceum.

BIG VILLAGE BOOSTERS.

One of the automobile organizations which is more or less an outcome of the annual New York show is that known as the Big Village Boosters, composed of dealers and agents in the Metropolis. The annual beefsteak dinner took place Jan. 14, at the Murray Hill Lyceum. Each guest was decked with a white apron and green ribbons bearing the Father Knickerbocker emblem of the organization.

The guests of honor were pioneers of the automobile industry—men who were engaged in solving the problem of making the new type of vehicle in 1900 and before. Among those who accepted invitations were: Charles E. Duryea, Saginaw, Mich.; Louis Clarke, Ardmore, Penn.; Elwood Haynes, Kokomo, Ind.; J. Frank Duryea, Chicopee Falls, Mass.; John Brisben Walker, San Francisco, Cal.; A. L. Riker, Bridgeport, Conn.; A. L. Pope, Hartford, Conn.; D. P. Dorris, St. Louis, Mo.; Charles Metz, Waltham, Mass.; Howard E. Coffin, Detroit, Mich.; Wallace Owen, Indianapolis, Ind., and S. J. Newman, Chicago, Ill.

Speechmaking played but little part in the evening's festivities, but Mr. Walker took occasion to recall the Cosmopolitan race of 1896, in which 16 cars started and only four finished the run from New York City to Irvington-on-the-Hudson for prizes aggregating $3000 offered by him. In the course of his remarks he named the committee of judges selected for this event, all but two of whom are now dead. They were: John Jacob Astor, Frank Thomson, Vice President Webb of the New York Central, Gen. Nelson A. Miles and Chauncey Depew.

HOOSIER SHORE DINNER.

A special train of nine cars brought the Indiana manufacturers to New York from Indianapolis. Soon after the arrival of the train, Jan. 11, the members of the party went to Coney Island, where they enjoyed a shore dinner. The principal item on the menu was steamed clams,

Digitized by Google

something which is lacking in the Hoosier state.

Among those present were: Charles Y. Knight, David Beecroft, John M. Robbins, W. H. Stevens, E. G. Westlake, R. B. Burch, J. A. Dougherty, W. L. Colt, Harry L. Stratton, J. J. Cole, George H. Strout, G. H. Henderson, D. F. Wheeler, J. G. Monihan, C. S. Crawford, C. E. Gordon, E. H. Walton, C. H. Gurnett, C. J. Maxson, R. W. Macey, C. W. DeLong, C. E. Brown, L. B. Brown, G. Ratcliffe, Ezra Meeker, W. H. Flessell, S. J. Turkenkoph, W. L. Burgess, A. G. Partridge, F. N. Nutt, G. A. Weideley, W. L. Esterly, Bruce Daniels, Homer McKee, W. G. Gilbreath, Harry Stutz, William Parkinson, Gilbert Anderson, Robert E. Maypole, L. R. Smith, G. T. Briggs, H. L. Wilson, J. F. Morrison, S. S. Jenkins, V. J. Jacobs, J. W. Fitzgerald, W. Raignel, H. H. Rice, A. B. Wagner, F. E. Wing, Carl Fischer, L. L. Bassford, S. B. Smith.

TOURING SOCIETY ENTERTAINS.

Officers and members of the Motor Car Touring Society of New York City celebrated the opening of the annual show with a dinner and dance at Sherry's Jan. 13. The tables were set in the ball room, before a miniature club house, and another feature of the entertainment was the music, furnished by members of the society seated in a 1913 model touring car before this structure. Bagpipers also strolled among the guests and alternated with the other musicians in making the time pass pleasantly. After dinner dancing was enjoyed.

The officers of the society are: President, Albert Eugene Gallatin; vice president, Percy R. Pyne; secretary, Orme Wilson, Jr. These were assisted by W. B. Osgood Field, Herman Oelrichs, Francis L. V. Hoppin, Malcolm Douglas Sloane, M. Taylor Pyne, Jr., R. Thorton Wilson, Alexander D. B. Pratt, Newbold Morris.

MOTOR TRUCK CLUB.

Perhaps the most important event of the second week was the breakfast of the Motor Truck Club of New York City at Rector's Jan. 21. About 300 men intimately associated with the commercial vehicle industry, either as manufacturers, dealers or users, partook of the six course menu, after which a short programme of addresses received unusual attention.

F. F. Beall of the Packard Motor Car Company spoke on "Advertising and Selling." P. D. Wagoner, president of the General Vehicle Company took for his subject "Operating Motor Trucks." Elisha Flagg, Jr., general manager of maintenance for the American Express Company, told his hearers of "Motor Truck Service." George H. Duck, general service manager for the American Locomotive Company, was somewhat reminiscent with "Past—Present—Future," although of course there was something to be said on the two last phases as well as the first.

HUDSON MEN AT RECTOR'S.

The annual dinner given by the A. Elliott Ranney Company, New York City, distributor for Hudson cars, to the officials of the parent company was held Jan. 15 at Rector's. The guests of honor were: E. D. Chapin, president; Howard E. Coffin, designer and vice president; E. H. Broadwell, vice president; F. E. Beznor, secretary; E. C. Morse, general manager; C. C. Winningham, advertising manager, and W. J. MacAneeny, factory manager. The hosts were: President A. M. Day, Vice President A. Elliott Ranney, Secretary Stearns and General Manager S. L. Toback.

MANUFACTURERS AT THE SHOW.

The number of factory representatives in New York during the show was decidedly large, as is evidenced by the following partial list of such men stopping at the various hotels:

Hotel Astor—Benton G. Dodge, Standard Welding Company; J. N. Gunn, C. H. Booth, E. R. Benson, A. I. Philp, W. S. Pettit, P. H. Bruske, W. H. Brady, A. H. Pearsall, Orin S. Wilson, W. C. Shanafelt, E. H. Carpenter, R. J. Miller, I. A. Buck, W. I. Brown, Leigh Lynch, J. G. Haeslett, Charles Gordon, A. Mais, C. J. Reynolds, Hanson Robinson, W. R. Grant, J. L. Hibbard, J. C. Austin, William MacGlashen, E. Mackie, Studebaker Corporation; R. D. Chapin, R. B. Jackson, H. E. Coffin, F. O. Beznor, W. J. McAneeny, W. W. Garrison, G. G. Bain, W. R. McCullough, E. C. Morse, P. D. Stubbs, J. N. Hill, S. P. Jackson, Jesse Draper, Richard Bacon, Hudson Motor Car Company; H. B. Joy, S. D. Waldon, Alvan Macauley, H. H. Hills, L. J. Smith, F. G. East, A. J. Neerken, C. J. Moore, Russell Huff, J. C. Vincent, C. R. Norton, R. C. Chase, A. E. Dixon, E. S. Church, F. W. Dalziel, C. R. Lester, G. S. Loomis, A. E. Corbin, O. C. Wieneke, E. C. Cooper, F. A. Stalker, W. D. Walker, J. H. Hunt, O. E. Hunt, Alfred Knight, F. F. Beall, F. R. Robinson, J. E. Locker, M. Tibbetts, C. A. Francis, B. W. Burtsell, C. E. Morton, Allen Loomis, Ralph Moore, W. F. Schmidt, E. F. Rauss, M. W. Rudd, E. J. Ellis, R. S. Davey, H. D. Church, Packard Motor Car Company; H. R. Radford, E. D. Knowles, W. C. Mahoney, George Reason, L. R. Fast, D. M. Ferguson, F. J. Campbell, C. M. Babbit, Cartercar Company; W. S. Lee, C. S. Briggs, W. G. Livingston, Briggs-Detroiter Company; Charles S. Monson, Edmunds & Jones Manufacturing Company; Edward McMasters, Charles Gray, United States Tire Company; E. C. Howard, Carl Chandler, E. C. Molter, P. Merrill, G. McMullen, William Blaine, E. C. Garladm, A. C. Westphal, Cadillac Motor Car Company, and representatives of the Peerless Motor Car Company and Goodyear Tire & Rubber Company.

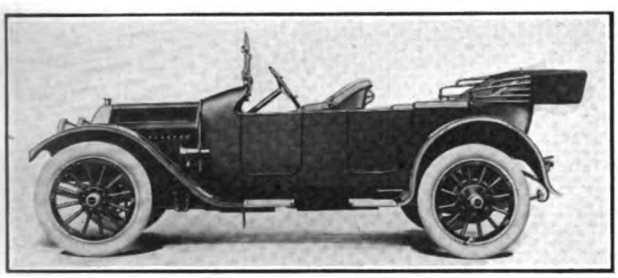
Arlington—J. Richards, Cataract Rubber Company.

Commodore E. C. Benedict of Greenwich, Conn., connected with a rubber tire concern, at a recent special town meeting advocated the expenditure of $600,000, to be raised by a bond issue, during the next six years, for building a concrete and bituminous permanent road bed over 41 miles of connecting town roads. The resolution, which was presented by the Taxpayers' Association, an organization of New York business men who reside at Greenwich, was passed almost unanimously.

The record of the Cadillac car, made by the Cadillac Motor Car Company, Detroit, from Los Angeles to San Francisco, Cal., made two years ago in December, still stands, despite the many attempts to better it. The time was 14:19:00, and the run was made in accordance with the rules of the Fernando Nelson award, which requires that the car be fully equipped, be stock in every detail and carry four passengers. Donald Lee and his associates in the Cadillac branch at Los Angeles recently celebrated the winning of the Nelson cup in a fitting manner.

The January issue of Graphite, published by the Joseph Dixon Crucible Company, Jersey City, N. J., contains an interesting summary of the racing situation for the 1912 season. This is illustrated with a number of the best known drivers of the year, all of whom utilized Dixon's graphite in the races in which they were winners. The number will be found of particular interest to motorists, and like all of the graphite publications issued by this company, is free upon request.

A catalogue which is decidedly out of the ordinary is that prepared by the Michigan Motor Car Company, Kalamazoo, Mich., calling attention to the Mighty Michigan 40 for the 1913 season. The text and illustrations cover the entire matter in a most satisfactory manner, but it is impossible to dismiss the subject without mention of the very excellent typographical appearance. This was the work of the Joseph Mack Printing House, Detroit, and is strictly in keeping with the merits of the product described.



During the recent Paris Salon there were 433 ignition outfits shown as part of the complete cars and engines on display. Of these 83.3 per cent. were Bosch magnetos, a source of some little gratification to the Bosch Magneto Company, New York City, particularly as these figures indicate an increase of 10 per cent. over those of the 1910 exhibition, in the face of greatly increased competition.

Digitized by Google

BODY DESIGNS REVEALED AT THE SHOW.

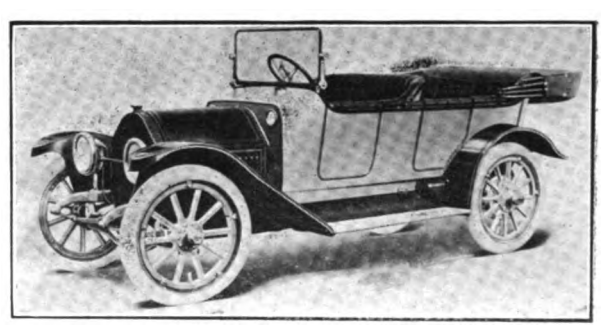
Special Attention Has Been Directed Toward Developing Attractive Lines and Appointments Making for Comfort and Convenience, Particularly in Touring.

IN ONE respect, at least, the New York show was decidedly different from its predecessors of recent years. The specially constructed

Attractive Outlines of Deep Scuttle Dash, Sloping Toward the Hood, as Exemplified in Oakland Cars.

bodies, largely of the enclosed types, were by no means so numerous as heretofore. Last year, for instance, the number of such cars on display was so large as to occasion decided comment. Almost all of the makers who exhibited on the ground floor in Madison Square Garden presented one or more, and some were to be found on the second and third floors. This year there were but very few.

As a result, it may be taken for granted that practically all of the cars shown at Madison Square Garden and Grand Central Palace were stock models in every respect. This being true, the show reflected the attention which has been given by American producers to the matter of body design. And it may be added that there has been every endeavor to create harmonious lines, giving the entire assembly an attractive and pleasing appearance.

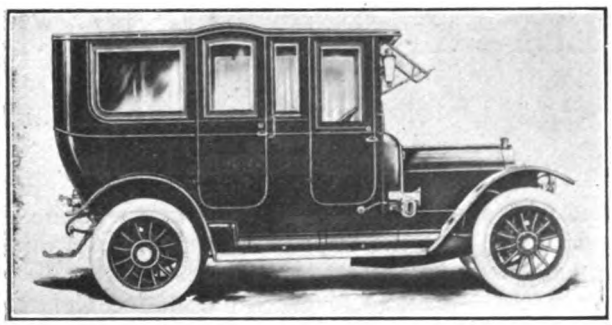


Perhaps the feature which first comes to mind is the lengthening of the wheelbase, although this has been more or less noticeable for the past two years. The increase in the number of six-cylinder machines has been such as to give the impression, when a large number of cars are displayed together, that this matter of wheelbase has been given even more attention than the figures would seem to indicate.

The use of underslung springs, and the list of manufacturers following this practise has been increased somewhat over last year, brings the body much lower than formerly and still further accentuates the long, low appearance. This effect is carried out with the enclosed cars, as well, and with some of these the whole construction is such as to give the impression that interiors are much lower than really is the case.

Stream line effects are quite noticeable, the clean running boards, fore doors with concealed hinges, dash blending with the hood, tires carried at the rear, side lights flush with the front of the dash and other features of a similar character uniting in carrying out this design. Still another item in this connection is to be found in the fitting of bodies with straight sides, instead of the rounded lines of more recent years, or if there be deviation from the perpendicular it is near the top, this applying more especially with enclosed cars.

The movement toward a clean running board has been prominent for a number of years, but there is little question that it has been carried further than ever before. In some instances it has been found desirable to cater to the needs of the tourist by locating suitcase compartments at the side, but the problem has been studied with an attempt to so place these as not to interfere with the full utilization of the running board. In some instances, notably the Marmon, that portion of the running board forward of the dash and alongside the motor bonnet has been recessed to take the luggage compartment on one side and a tool box outfit on the other.

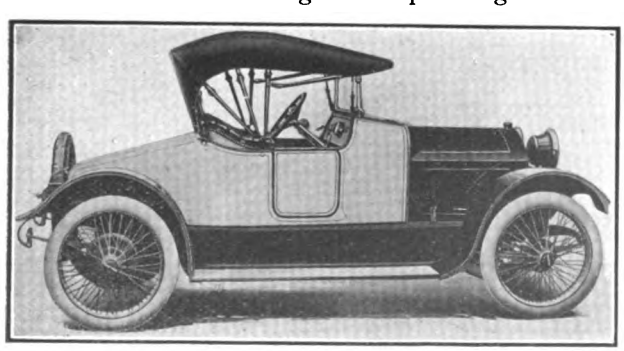


The fitting of fore doors has now become general, if indeed this was not the case a year ago. Perhaps the most noticeable feature in this connection is the number of makers who are fitting

Cartercar Model Presents Stream Line Effects, Clean Running Boards, Doors with Concealed Hinges, Etc.

four real doors, the control levers either being located in the centre or in such position at the right as to be entirely within the body and out of the

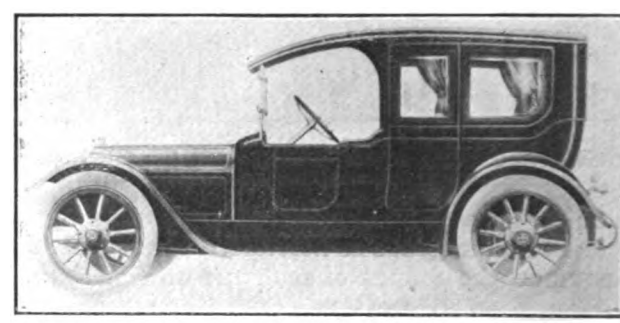
Digitized by Google



Knox Berline, Indicating Provision for Easy Access to Passenger Compartment.

way of ingress and egress. This has been carried a step further by the utilization of doors with concealed hinges, so that the sides of the car present a clean appearance from front to rear. And in many instances the doors are of such height as to blend with the top of the seats and still further accentuate not only the stream line appearance, but the long, low construction previously mentioned.

The blending of the dash with the hood is very noticeable. A stroll through either the Madison Square Garden or the Grand Central Palace could not fail to bring out this point. Some makers have carried the matter much further than others, but the trend is strongly toward the curved dash, the curve either meeting the rear of the hood and tapering toward the radiator or very nearly so.



In this connection it may be proper to call attention to the very general use of the cowled dash, and in many instances the fuel tank is located therein. A discussion of the advantages of this construction has no place in a consideration of body design, although the arguments in its favor may be obvious. With some there is a tendency to use two filler openings, so that the tank may be filled from either side of the car, while with others but one cap is utilized. In either case these filler members are made to harmonize with the other fittings in a pleasing manner.

Clean Running Boards and Sides Free from Obstructions as Seen on the Henderson Roadster with Wire Wheels.

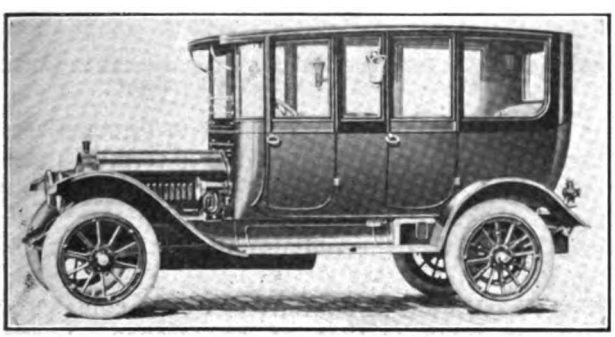
Side lights flush with the front of the dash began to make their appearance at last year's show. The very large number of cars utilizing this feature this year would seem to indicate their popularity. Accompanying sketches call more direct attention to this matter. The view of the Knox may be cited as most representative in this respect, although it presents other features to which attention will be drawn later.

The Peerless construction may be regarded as unique, with its hooded projection over the light, and when seen in connection with the balance of the car, which is a berline limousine, is quite pleasing. The Oakland design also is novel, and the view shown brings out the sloping dash,

Garford Town Car with Sloping Roof, Following Latest Foreign Practise.

blending with the hood, which terminates with a radiator of particularly attractive appearance. The American side lights are half hidden away in recesses, and the dash and hood are so modelled as to carry out this recessed effect to the very front of the car.

Some of these sketches, particularly those of the Knox and Peerless, call attention to the system of ventilation provided for the occupants of the forward seat. With some there has been the fitting of detachable fore doors, but since these members are counted upon to assist in a measure in creating a favorable impression of the body lines, there has arisen a desire to obviate the necessity for their removal. Many makers are equipping fore doors this year, which admit of being opened slightly at the front, being held in that position by short straps or hinged rods.



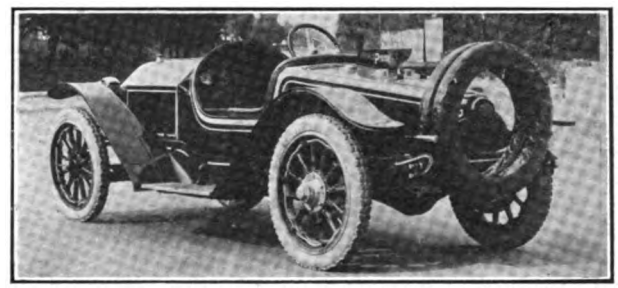
Several types of ventilators also have made their appearance. Perhaps those most generally employed are of the circular design, either being located in the dash or at the side just to the rear of the dash. These made their appearance coincident with the flush side lights a year ago. It will be noted that the Knox has carried the matter a trifle further, ventilators being located just over the hood near the top of the dash and at the bottom beside the bonnet. This design has been

Digitized by Google

worked out by other makers in a slightly different manner, some of them only utilizing one ventilator on a side, the location being a matter of difference in opinion. The Peerless ventilator works on the door principle, and is held open or closed by a system of small rods.

Pointed radiators are very much in evidence this year. If memory serves correct there was but one exponent of this design at the show a year ago. This year there were several and it cannot be denied that they played their full part in carrying out the pleasing body lines. Those shown herewith are but individual illustrations, some of the others displayed being along similar lines and quite as interesting in themselves.

With the effort to secure a clean running board has come the utilization of former waste spaces for carrying tools and other paraphernalia. With many manufacturers there has been a tendency to find such space beneath the frame or just above it, entrance being gained through the shield between the running board and the frame. These are almost too numerous to be considered separately or to excite special comment, although

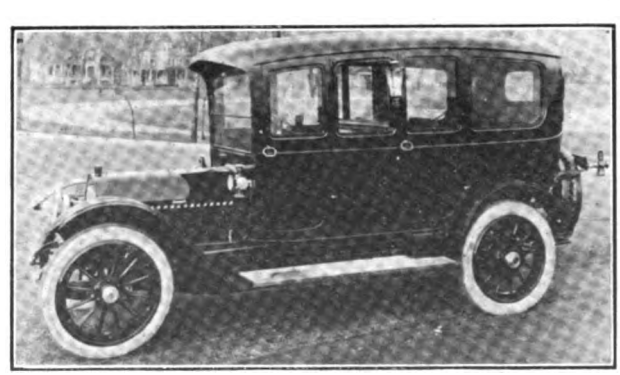


White Berline Limousine, Illustrating Attractive Lines of Individual Design.

the methods employed are decidedly unique in many instances.

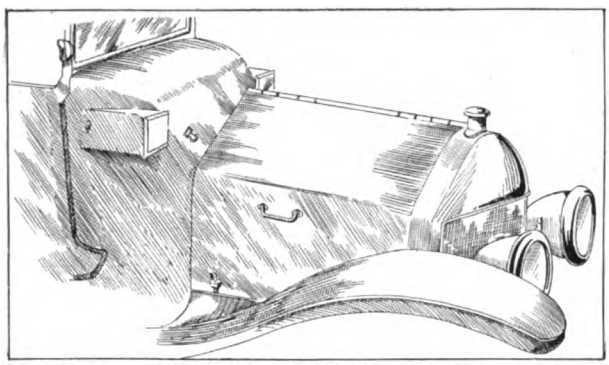
When the scuttle dash is not used to house the fuel tank, it has been found of service along this line. Similar resting places are located between the front seats. In some instances this "waste space" has been utilized to house the lighting and starting switch, and in others the gasoline tank filler pipe has been brought up between the seats where it is readily accessible without disturbing the occupants of the car. The Henderson has brought its control levers back to the seat position, one of them actually being between the seats and the other immediately in front of it.

The rear deck is utilized not only for carrying tires, but several makers have found it possible to construct one, and sometimes two, carrying compartments there as well. Some of these are



The Pathfinder Cruiser Model, One of the Novelties in the Show, Following Lines of Foreign Designers.

shown herewith. With the Cartercar the upper compartment is for luggage, while the lower, which is practically the full width of the body, is for spare tires and tubes. The Fiat has a large locker for tools at the rear. The Michigan roadster has a particularly neat construction with plenty of room for tools and luggage.



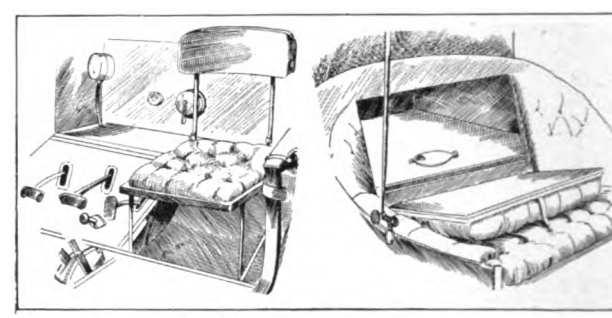
The space beneath the rear seats has been brought into play in a new and novel manner with some cars. Several producers have specially prepared compartments for side curtains, and the KisselKar is only one example of many which fit a long door in front so that these compartments may be reached easily. The Mercer and Oakland have provided liberal sized lockers in the form of tonneau foot rests.

It is somewhat surprising to note that many of the roadsters are plentifully supplied with luggage compartments. The Firestone-Columbus is a particularly good example. The back of the seat, which by the way is considered of ample size to accommodate three persons with ease, is fitted as a suitcase compartment, while underneath is a special steamer trunk as well. This car has another feature which cannot help but make its appeal. The driver is located at the left, and the dash in front of him contains all the necessary controls. The other half of the dash is entirely free, but the lid is so constructed that it hides a folding extra seat, which faces backward,

Locomobile Berline Limousine Presents Still Other Features of Individuality.

Digitized by Google

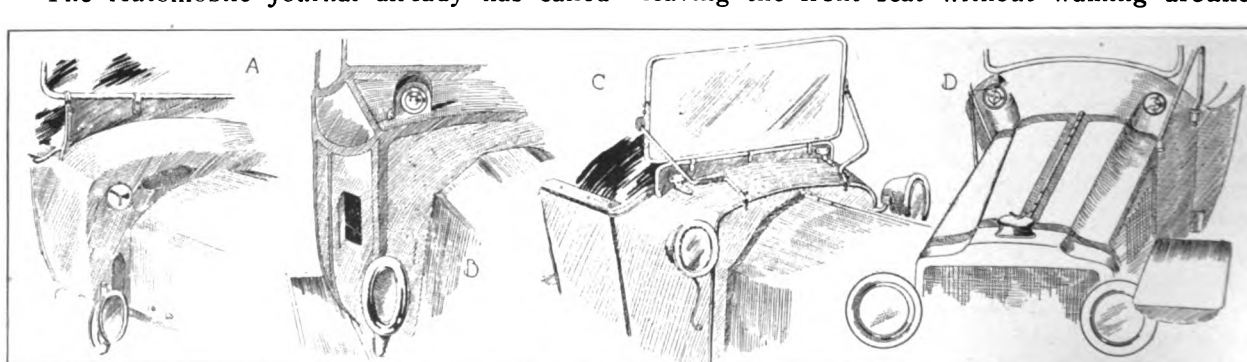
Distinctive Side Lights and Sloping Dash Blending with Hood on Oakland Cars.



making provision for still another passenger. Side curtains of substantial material may be adjusted in a few seconds, so that not only the occupant of this seat, but the others in addition are offered desirable protection from wind or weather.

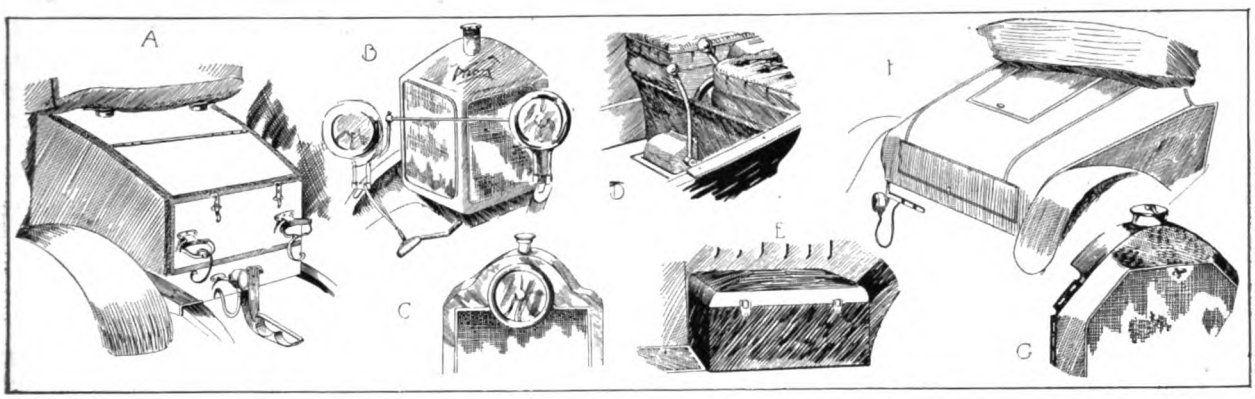
The Cole roadster was shown last year with two additional seats, one at either side over the running board, which were disclosed only when needed. This is continued this year but with three seats only and additional features, among which may be mentioned the provision at the rear for carrying luggage, etc. Tires are carried outside over the luggage compartment, while the space between this compartment and the rear of the seats also is available for the overflow.

Another machine of distinctive design is the Pathfinder cruiser model, in which the pointed rear is decidedly suggestive of foreign practise, although the construction is by no means as radical as some of the bodies which were displayed at the shows abroad. The rear deck is made to house the fuel tank and a luggage compartment, while the extra tires are carried in a perpendicular position directly over and around the pointed rear end.



The Automobile Journal already has called attention to the matter of utilizing the dash for numerous control devices, etc., and it only seems necessary to mention here that with the deep scuttle ample provision has been made for lighting these control boards. Some makers have carried the solution of the problem much further than others, but with most of them there has been a very evident desire to supply the necessary illumination.

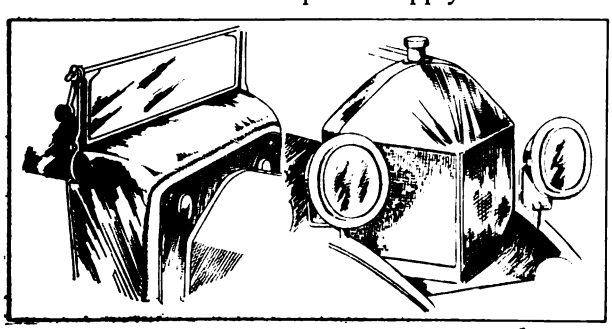
With enclosed cars the subject of interior lighting has been considered in detail. Dome lights, corner lights and lights for illuminating the step were features which attracted attention a year ago, but in many instances there has been an effort to create an artistic impression as well as a useful equipment. The Garford goes a step further, perhaps, by fitting what is termed a tonneau light in the centre of the rear of the front seat. This is quite in keeping with the single headlight above the radiator in the front of the machine.



Folding Seat at Left and Suitcase Compartment at Right, Features of Firestone-Columbus.

The question of comfort has been considered quite as much as that of appearance. Large, roomy seats with plenty of leg room are features on practically all cars. The arguments in favor of the left hand drive, which include the desirability of affording means for entering and leaving the front seat without walking around

Body Features Seen at the Shows. A, Knox Dash with Flush Side Lights and Ventilators; B, Peerless Hooded Lights and Ventilating System; C, Method of Attaching Windshield Supports on Marion; D, Recessed Lights and Grooved Hood on American.



Digitized by Google

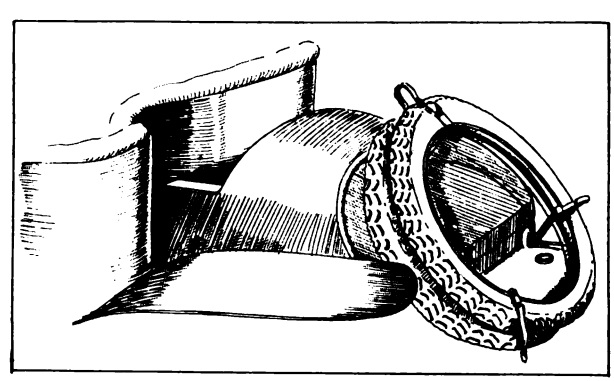
Additional Body Features:. the car, have not only resulted in the adoption of this location of driver with an additional number of makers, but with others the control levers have been placed in the centre or in such position that they do not interfere with the use of either front door.

The subject of upholstery is particularly interesting, and it almost may be said that it has been given special attention by nearly every maker. In some instances the cushions seem to extend to the very floor of the car, and with all there has been attempt to supply that which

Sloping Dash, Flush Side Lights and Pointed Radiator on Imperial Cars.



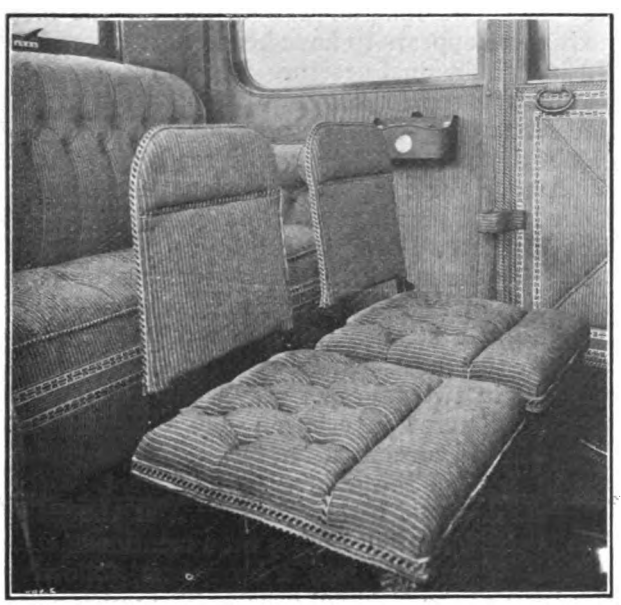
would meet with the approval of the most exacting.

This is true alike of the enclosed and open types. Bedford cord and similar materials are being used quite extensively for both. Adjustable seats are to be found in the tonneau as well as in front. In fact the attention paid to the matter of seating accommodations is quite as marked as with any other detail of design and construction.

The enclosed cars were not as numerous as in other years. While those displayed were of attractive design, the new features were not as marked as with the open types. There has been some attempt to follow foreign practise with roofs which slope toward the front to blend with the hood and radiator design, but for the most part there appears to have been effort to produce striking individual designs. In this respect there is much reason for congratulation on the part of the American constructors, for there is little doubt that these will meet with ready acceptance.

Among these individual designs may be mentioned the Locomobile berline limousine, which was of the two-compartment type, the forward being for the driver. The rear was transformed into a miniature drawing room, equipped with all the little niceties which might make an appeal to the most fastidious. The exterior was finished in two tones of red, while the interior was upholstered in crimson silk. Small gold lamps in the corners added not a little to the attractiveness of the interior arrangement.

Two enclosed cars were shown at the Peerless booth, one of which has been mentioned elsewhere. The other was a brougham, following the lines of the Colonial coach. The outside finish was in yellow and black, while the upholstery was in brown leather of velvet finish. The dome lights of amber glass accentuated the brown



Rear View of Cole Roadster, Designed to Accommodate Three by Utilizing Disappearing Seat.

Digitized by Google

dome, and the flower vases and carpetry were of the same amber hue. Under the arm rests which divided the rear seats was a cellarette, and a table was arranged to be swung into place when desired.

The Packard cabette also was styled as a two-passenger brougham. This was illustrated in a previous issue, and may be described briefly as following the sloping roof design recently so popular in France. Another car which carried out this idea was the town car shown at the Garford stand, and reproduced herewith.

The Knox berline limousine was quite in keeping with the enclosed cars shown by this maker last year. The body was of metal, but finished in imitation mahogany. The interior upholstery was in maroon broadcloth to harmonize

Interior View of National Limousine, Showing Attention Paid to the Matter of Upholstery.

with the exterior, while the driver's compartment was finished in dull red leather.

At the National booth was a decidedly attractive limousine in green, the upholstery being in brown whipcord. The most conspicuous machine at the White stand was a berline limousine in dark green with red monogram stripes. Other enclosed cars displayed will be revealed in tabulated form elsewhere in this issue.

There are now under construction at the plant of the Studebaker Corporation, Detroit, maker of Studebaker cars, four large buildings. One of the most interesting is the new forge shop which is being built around 40 power hammers that are constantly busy on parts.

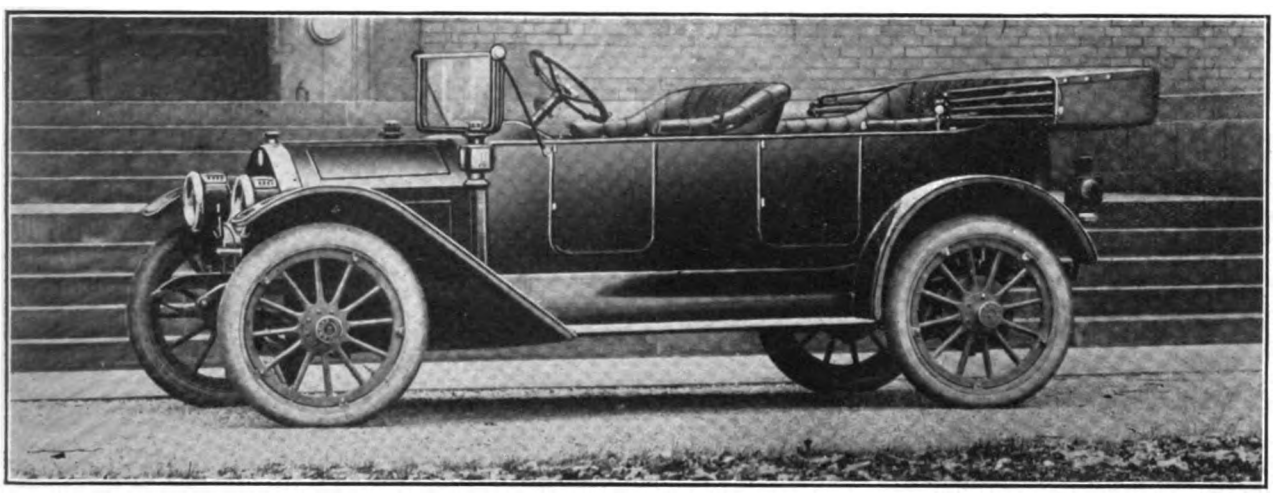
SAVANNAH TO GET RACES.

Grand Prize and Vanderbilt Cup Events Tentatively Awarded to Southern City.

Representatives of the Savannah Automobile Club recently met the Motor Cups Holding Company's executive committee at the rooms of the Automobile Club of America, New York City, and made arrangements for the holding of the Grand Prize and Vanderbilt Cup races in the Georgia city. No exact dates were set, but it was stated the races probably would be run some time between Nov. 1, 1913, and Feb. 23, 1914. The latter date was set in order that a meet might be arranged for February if considered advisable.

Those representing the Savannah Club were: Harvey Granger, F. C. Battey, A. W. Solomon, Judge Hull and Judge Mott. Henry Sanderson, Colgate Hoyt and Henry B. Anderson represented the Motor Cups Holding Company. Before the races can be finally awarded to Savannah the approval of the Automobile Club of America, for the Grand Prize, and of the American Automobile Association, for the Vanderbilt Cup event, must be secured.

Manager Bart Ruddle of Milwaukee, Wis., where the races were held in 1912, when informed of the New York meeting, said he was surprised that the Milwaukee men were not asked to appear also. He added that Milwaukee would not allow the races to go to Savannah by default and that a committee would be sent to New York City immediately after the annual automobile show this month. A telegram to this effect was sent to W. K. Vanderbilt, Jr.



The decision of the Chicago Automobile Club to undertake the promotion of contests other than road races and interclub team matches has been announced. The organization will hold a day and night reliability run from Chicago to Boston by way of New York City. This will be the first time that cars have travelled at night in a reliability contest and the keynote of the entire scheme is that the motors shall be kept running continuously from the time they leave Chicago until they check at Boston, if the drivers desire to escape penalization. The event will probably be held in June and eastern automobile clubs have already assured their co-operation.

John C. Nicholson, secretary of the Meridian Road Association, Winnipeg, Can., recently arrived at Galveston, Tex., after logging the 2000 miles of the Winnipeg-Meridian to the Gulf road.

DETAILS OF EMPIRE LITTLE ARISTOCRAT.

AMONG the cars displayed for the first time at the Grand Central Palace, New York City, was the Empire Little Aristocrat, model 31, the product of the Empire Automobile Company, Indianapolis, Ind. It is a five-passenger touring car of attractive design, and will appeal to the discriminating buyer as its construction is in every way substantial. There is a large factor of safety in each detail and all wearing parts are unusually substantial, making for durability and minimum cost of maintenance. Those principles incorporated in the previous model and which are well established and indorsed by sound engineering practise, have been continued in the new chassis, but with the addition of refinements and improvements, exemplifying the policy of the company in this respect.

Empire Little Aristocrat, a Five-Passenger Touring Car Having Over Size Tires and Being Fully Equipped.

Adequate adjustment for wear and accessibility for inspection and work are among the qualities of the new Empire and one of the striking features is the clean chassis. Its design is extremely simple and contains many mechanical refinements usually found only in high priced automobiles. The horsepower production is ample for all requirements and the machine has sufficient speed to meet the approval of those who desire a serviceable and practical car, easily maintained at a minimum of expense. The equipment of both the chassis and the body is very complete, including those features making for comfort and convenience of operation, and provision for electric lighting.

The motor is a highly perfected unit of four cylinders, these being of the L head type, cast in pairs, and the material employed is a special gray iron. The water jackets are unusually large as are the inlet and outlet water manifolds. The engine block is bored, machined, then aged and later reamed and ground, a process minimizing the possibility of damage from internal stresses. The inlet and exhaust valves are at the left and the design and construction of the pockets are such that these members are readily accessible for inspection and cleaning. The bore is 3.75 inches and the stroke 4.5 inches, which places the motor in the long stroke class. The piston displacement is 198.8 cubic inches.

The pistons are of a special gray iron, turned to size and carefully ground. The rings are ground and carefully fitted, insuring perfect compression on all cylinders and an efficient motor. The crankshaft is drop forged, of high carbon steel, 1.75 inches in diameter and is ground accurately to size, the limit being .002 inch. It rotates in three large bearings, these being three, three and four inches, respectively. White brass is utilized as bearing material throughout. The bearings are fitted carefully and subjected to a rigid inspection before being passed.

Valve Mechanism Enclosed.

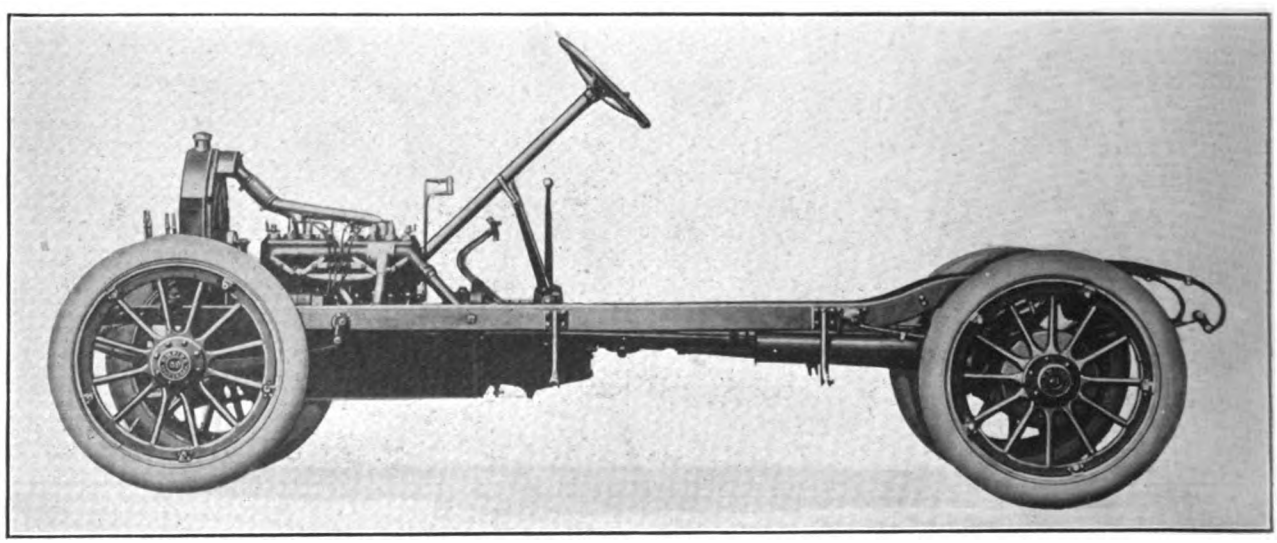
The camshaft is a high carbon steel with cams integral, and is mounted in four bearings of ample size. The cams are well designed and the utilization of fiber inserts on the tappets makes for a noiseless motor. The valves are ample in size, with adjustable stems, and the valves, springs, tappets, etc., are enclosed against dust or foreign elements, much prolonging the life of

Digitized by Google

the mechanism. The pushrods are solid, of a high grade steel, accurately machined and ground. The timing gears are of large diameter, carefully cut, and, operating in a bath of lubricant, are noiseless.

One of the qualities of the motor is the accessibility of the bearings, etc. Very large and easily removed inspection plates are fitted to the crankcase, and as these members extend practically the length of the case it is a simple matter to make adjustments when required. The exhaust manifold is large and the pipe carrying the exhaust gases free from bends, reducing back pressure to a minimum.

Efficient Lubrication.



In designing the lubrication system the engineers have made provision against smoking, yet have insured that each working part receives the proper amount of oil. The lubricant is taken from the reservoir in the crankcase by a positively driven pump and forced to a sight feed on the dash, thence to the three main bearings, whence it overflows to compartments in the crankcase. The ends of the connecting rods dip into the oil, splashing it to all working parts. A constant level is maintained, all surplus lubricant flowing to the sump, where it is filtered before again being circulated by the pump. The filler member is ample in size and very accessible. The oil capacity is 1.5 gallons.

Adjustable Carburetor.

Carburetion is by a model H Holley, located on the left side of the motor, and the vaporizer is fitted with the Holley special air adjusting device actuated by a dash lever. This enables the operator to enrich the mixture for starting when the motor is cold and carburetion is further aided by the utilization of heated air taken from the exhaust manifold through a flexible cable to the air intake. The intake manifold is not only compact, but is well designed, being free from bends. Particular attention has been paid to the machining of this member and one of the qualities of the design emphasized is that condensation of gas is eliminated and starting made easy in extreme cold weather.

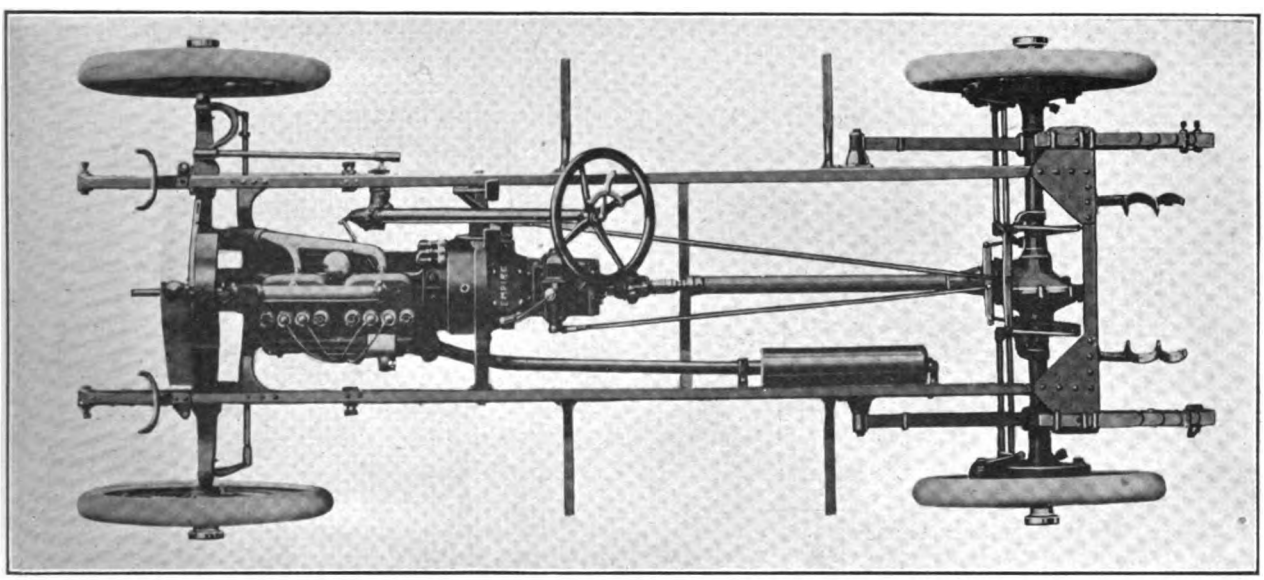
Set Spark Ignition.

Ignition is by an Eisemann true high-tension magneto located on the left of the motor and gear driven through a shaft. The company holds that the set spark is best adapted for all conditions of service and that not only does the design make for efficiency and simplicity, but that undesirable motor stresses due to improper use of a spark lever are eliminated. Operation is simpified in that but one control lever is mounted upon the wheel, that of the carburetor. It is also held that the magneto generates and delivers the spark at the proper time for combustion irrespective of motor speeds. The wiring plan is simple, there being but four short cables leading to the spark plugs and a single lead to the switch mounted upon the dash. The high-tension wires are neatly clipped to a fibre holder attached to a metal plate bolted to the stirrups retaining the intake and exhaust manifolds. Priming cups are fitted over the exhaust valve caps and the latter are well designed and of liberal size. A feature of these members is their accessibility by an ordinary wrench.

Side View of Empire Chassis Showing Low Centre of Gravity—All Parts Are Substantial, Making for a Large Factor of Safety and Durability.

Digitized by Google

Thermo-Syphon Cooling.



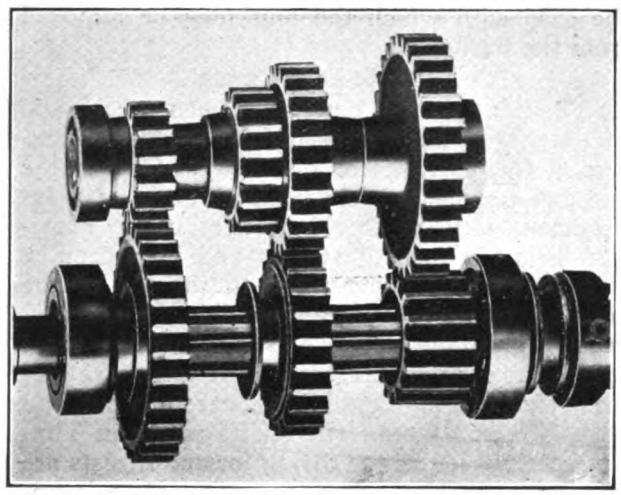
Cooling is by thermo-syphon, the cooled fluid entering the cylinders at the right of the motor, passing upward through liberal sized water spaces and around the exhaust valves, thence to the outlet manifold, to the radiator. Both manifolds are polished aluminum and unusually large, being 1.75 inches inside diameter. The radiator is of sufficient capacity to insure proper circulation under the severest kind of service and cooling is further aided by a large belt driven, ball bearing fan. The latter is adjustable and a feature of the construction is the utilization of a substantial ring secured to the radiator, which prevents the fan blades damaging the cooler in the event they become sprung through accident. The radiator is so mounted that it is not subjected to stresses due to rough roads. It is easily removed when desired.

Three Point Suspension.

The power plant, including motor, clutch and transmission, is assembled in a unit, anchored to the frame at two points and pivoted at the third. This three point suspension relieves the motor, clutch and transmission from all stresses when the car is traversing rough and uneven roads, and any twisting of the frame does not create misalignment, the distortion being absorbed by the frame supports. The third point of suspension acts as a swivel, equalizes and nullifies the conflicting strains. As will be noted by an accompanying illustration the weight of the power plant is evenly distributed between the three points of suspension. A quality of the design is the ease with which the unit may be removed from the frame.

Multiple Disc Clutch.

The multiple disc clutch has been refined and the Raybestos faced discs are nine inches in diameter, a size making for durability. One of the features emphasized in the clutch is its easy engagement, it being free from harshness. Provision is made for adjustment and inspection, a large hand hole being fitted to the top of the housing, where it is very accessible. The transmission is of the selective type, providing three speeds forward and reverse. The gears are ample in size, of a high grade steel, carefully cut, and have .875-inch faces. The shafts rotate in Timken bearings and those caring for end thrusts are also ample in size. The inspection plate is usually large and is fitted with an opening for renewing the supply of lubricant.



Plan View of the Empire Clean Chassis, Noticeable for Its Simplicity and Accessibility.

Large Universal Joint.

But one universal joint, mounted at the rear of the transmission housing, is utilized, as the drive is flexible and straight. It may be disassembled easily, is amply protected against dust and mud, and is packed with lubricant. Drive is by a large sized shaft of high grade steel and the torsion tube is sturdily constructed, being reinforced at the universal joint end where provision is made for adjustment of the driving shaft. The latter is squared at the universal joint end, a construction facilitating the removal of the rear system, and by removing the axle spring clips and detaching the brake rods the rear axle may be displaced quickly.

Digitized by Google

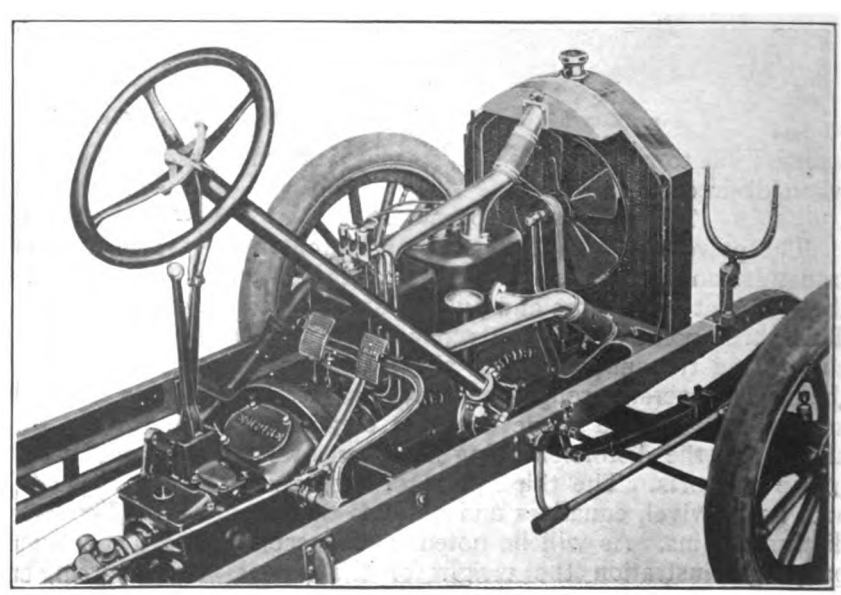
Showing the Large Gears Utilized in the Empire Transmission.

The rear construction is sturdy and is of the semi-floating Weston-Mott type. The axles are ample in size, of a high grade steel and high duty Hyatt roller bearings are utilized throughout. The gears are extra large in size, of a high grade steel and being carefully cut and meshed are noiseless. The housing is compactly designed, of great strength and light weight. Provision is made for the renewal of lubricant.

Feature of Axle Housing.

A noticeable quality of the Empire axle housing is the utilization of a 3.5-inch sleeve bearing member which is hardened and ground. The axle carries a hardened sleeve and the rollers bear upon these members, which are accurately fitted. The construction makes it a simple matter to replace these members when necessary, but the company points out that owing to the liberal size of the bearings the parts will not require attention.

The easy riding qualities of the Empire are attributed to the design and high grade springs employed. Each leaf is ground and polished and carefully assembled, and both front and rear members are ample in size. The rears are three-quarter elliptic, having six and eight leaves 1.75 inch wide. They are securely clipped and provided with grease cups for lubrication of the shackle bolts, which are ample in size. A feature of the design is the scroll end, which serves as a bumper plate. The two lower leaves of the upper spring are curved and carried backward to a point approximately over the rubber shock absorbing bumper, which is secured to the lower spring. Severe shocks are thus absorbed by the rubber and scroll member without submitting the springs to such stresses. The front springs are semi-elliptic, 1.75 inch wide and the six leaves are secured to the axle by substantial clips. The spring shackles are provided with two grease cups.



Large Front Axle.

The front axle of the Empire is very substantial. It is of the I beam section type, a drop forging, and the steering arms and knuckles are also drop forged and ample in size. The company maintains that these are large enough for a car having twice the power of the Empire and that the construction not only makes for durability, but is a factor of safety. The drag link and tiebar are sturdy; in fact, these components of the steering linkage are well designed and of high grade material.

One of the qualities of the Empire chassis is the strong frame. It is of pressed steel .1875 inch thick and with depth of channel 4.5 inches. It is kicked-up at the rear, providing a low centre of gravity and easy riding qualities. The rear cross member is reinforced by two unusually large gusset plates which are securely riveted.

Large Sized Brakes.

Special attention has been paid to the matter of brakes which are oversize when the weight of the car is considered. They are well designed

The Unit Power Plant of the Empire Is Very Compact.—Note the Simplicity and Accessibility of Its Components.

Digitized by Google

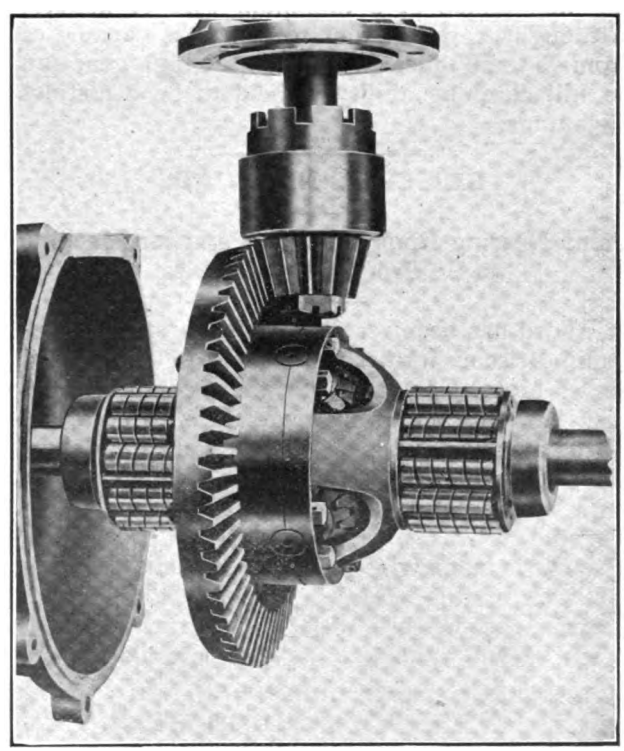
in that they are easy in engagement, yet may be applied so as to stop the machine instantly if desired. The service members are of the external contracting type, operating on 12-inch drums having two-inch faces. They are actuated by pedal. The emergency members are of the internal expanding type, operated by a hand lever at the left of the driver. Both sets are provided with efficient equalizers mounted over the differential and very accessible.

The wheels are of the artillery type with heavy second growth hickory spokes and have large hubs and a distinctive design of hub cap. They are fitted with Baker demountable rims and 32 by 3.5-inch shoes, both front and rear. In this respect the Empire is overtired and the company claims large mileage because of the equipment. One extra rim is supplied as standard. Provision is made for the carrying of two extra rims at the rear of the chassis, a tire holder being substantially anchored to the rear cross member. The wheelbase is 108 inches.

Warner Steering Gear.

Special attention is directed to the steering gear, it being a Warner of the full worm and gear irreversible type. Being of ample size great efficiency is secured and provision is made for adjustment. The column is set at an attractive angle and is surmounted by a 17-inch wheel. There is but one lever, that controlling the carburetor. It is very compact and easily operated by the driver.

Centre Control.



The operator's position is at the right with left hand centre control. The gear shift lever is of the cane type and a feature of the control is the short movement required to effect the different changes of speed. The emergency brake lever is at the left of the control member and both are mounted on the transmission housing. The clutch pedal is at the left and service member at right with the accelerator placed between them.

The gasoline tank has a capacity of 15 gallons and feed to the carburetor is by gravity. The tank is sufficiently high to maintain a constant flow of fuel to the carburetor even when the car is being operated on severe grades.

Attractive Body.

The body design is clean cut, the lines flowing in graceful curves from the metal cowl and dash to a full vestibuled tonneau. The sides are flush and four full doors are fitted, making the entrance and egress of passengers possible from either side of the car. The body is of aluminoid steel, wood trimmed and upholstered with resilient, deep buffed leather. The cushions are wide and the backs of the seats deep, providing comfort, and the rear seat easily accommodates three large persons. There is ample room in the tonneau between the back of the front seats and rear cushion, also between the dash and front seats.

The fenders are well designed and blend harmoniously with the graceful lines of the body. The skirt is well proportioned and with close fitting splash aprons the passengers and body are protected from mud and water. The hood, fenders, skirt and aprons are finished in baked black enamel, which will withstand severe service without deterioration. All metal trimmings are heavily nickel plated. The cars are nicely finished, the running gear being a French gray with Royal Empire blue body.

Illustrating the Sturdy Construction of the Empire's Final Drive.

Fully Equipped.

The Empire is fully equipped. The top is a high grade mohair with slip cover, and is fitted with curtains which may be applied inside the car, thus eliminating the necessity of standing in the rain when these members are being attached. The windshield is of the clear vision type. The speedometer is neatly mounted upon the dash, in connection with the magneto switch, carburetor control levers and oil sight feeds. The gas headlights, side and tail lamps are black enamel and nickel, and the smaller lamps are fit-

Digitized by Google

ted with electrical connections, making possible the installation of electric lighting if desired. Rubber shock bumpers, horn, gas tank with black enamelled cover, robe and foot rails, jack, pump, tools, tire repair outfit, etc., are standard equipment.

Low Cost of Maintenance.

Low cost of maintenance is claimed for the Empire, it being stated that 18 to 23 miles are secured to one gallon of gasoline, depending upon road conditions and the operator. Economy of lubricating oil is also emphasized. The Empire was designed for motorists desiring a car capable of carrying comfortably five persons and being maintained at a minimum cost of upkeep. Although geared at four to one, it is capable of from 45 to 50 miles an hour on the high gear and its hill climbing ability is held to be a distinct advantage.

BRISCOE'S NEW CAR.

Plans Nearing Completion in Paris for Machine to Be Produced in America.

Word has been received from Paris that Benjamin Briscoe, formerly president of the United States Motor Company, has about completed the new car that he is making. It is to be a low priced machine and is being developed in a laboratory in Paris with the assistance of 25 engineers.

Mr. Briscoe's idea of going to Europe to design the car was to get the best talent procurable. The car is made with reference to manufacturing facilities in this country, where it will be produced. Mr. Briscoe expects to return in May, when he will announce his complete plans.

WILL TOUR TO COAST.

Indiana Automobile Manufacturers' Association Decide Upon 1913 Trip.

The Indiana Automobile Manufacturers' Association has decided to start on its tour to the Pacific Coast at 8 in the evening of July 1. While it is possible to announce the date of the start with such precision, it should not be taken for granted that all of the details have been settled upon in like manner. Beyond stating that the tourists will visit St. Louis, Kansas City, Denver, Salt Lake City, San Francisco and Los Angeles, the itinerary is by no means complete.

It is expected the trip will occupy 25 days, and the remaining details have been left to the following tour committee: W. McKay White, Marion Motor Car Company; A. B. Wagner, Nordyke & Marmon Company; Frank Nutt, Haynes Automobile Company; Jean Marks, Service Motor Truck Company; H. G. Dupree, Remy Electric Company. In addition the following have been appointed to take charge of particular duties: Night stops, J. G. Monihan, Premier Motor Manufacturing Company; supplies, Harlow Hyde, Empire Automobile Company; costs, E. Mack Morris, Great Western Automobile Company; coast affairs, Frank J. Morris, Cole Motor Car Company.

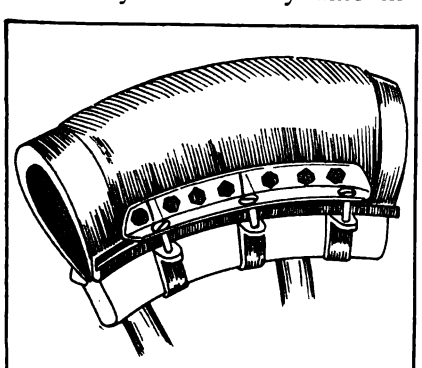
ELECTRIC OPERATING EXPENSE.

Iowa Owner Submits Figures Which Should Prove of Interest to Others.

Through President Louis E. Burr of the Woods Motor Vehicle Company, Chicago, maker of Woods electric machines, a Mr. More of Sioux City, Ia., submits some interesting figures, giving the total expense for current during the past two years. Mr. More writes that Mrs. More uses her Woods electric on every possible occasion, it seems to him, and that there were absolutely no other expenses for operating the car. The figures were compiled Dec. 2, and are as follows:

	1911	1912
January	$5.48	$2.51
February	1.00	3.45
March	1.48	2.00
April	3.76	3.00
May	7.85	2.00
June	8.78	3.30
July	7.75	4.85
August	6.50	3.40
September	3.19	3.20
October	8.66	4.85
November	4.34	2.00
December	3.55	...
Totals	$62.34	$34.56
Total for two years		$96.90

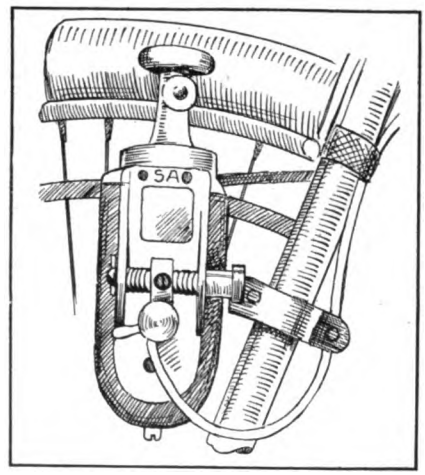
At the annual meeting of the National Automobile Association at Boston, the following officers and directors were elected for the coming year: President, R. Elmer Townsend; first vice president, A. G. Bullock; second vice president, Elmer J. Bliss; treasurer, Allen Forbes, secretary and counsel, Francis Hurtubis, Jr.; directors, Elmer J. Bliss, Bryce J. Allan, John H. Child, B. Leighton Beal, George D. Clapp, Neal Rantoul, William B. Plunkett, Edward A. Stevens, Francis Hurtubis, Jr., George E. Phelan, John L. Bates, J. C. R. Peabody, Harry W. Cotton, R. Elmer Townsend, Allan Forbes, E. S. S. Keith, Arthur H. Lowe, Spencer Borden, Frederick Harris, Harry L. Burrage, Frederick C. Hood, A. C. Bullock, John M. Longyear, Horace C. Jealous, Costello C. Converse, Harry M. Stonemetz.



Digitized by Google

NEW ACCESSORIES

THE display of accessories at the New York show attracted a large number of visitors, both at the Grand Central Palace and Madison Square Garden. Many makers exhibited at the former, owing to a lack of room at the Garden, where the basement and balcony spaces were occupied by representative concerns and those showing for the first time. Although several new devices were exhibited they did not compare in numbers to those at previous shows, and it was noticeable that the majority were electrical. Electric lighting equipment for motorcycles made its appearance and one well known company displayed a tiny generator, the armature of which is actuated by a friction wheel in contact with the tire.

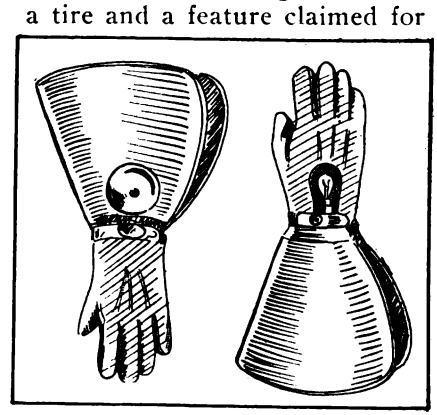


Lucifer Lighting Equipment.

A novel and practical lighting equipment for motorcycles and bicycles has been brought out by Marburg Bros., Inc., United States Rubber Building, New York City. It is a dynamo in

Dyke's Bolted-On Outer Boot.

that it generates electricity for supplying a headlight mounted upon the frame of the machine. The construction of the dynamo is very similar to the Mea magneto, a bell shaped magnet be-



Lucifer Electric Lighting Equipment for Motorcycles.

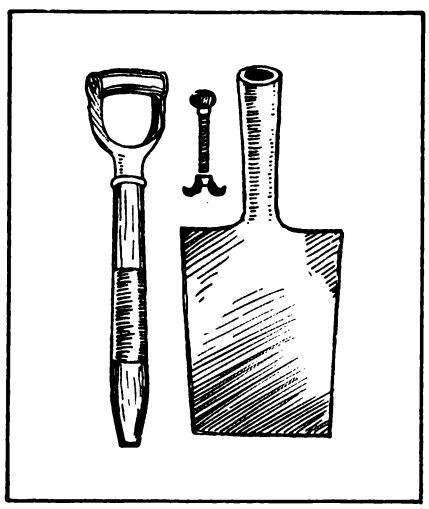
ing employed and the armature being mounted in the axis of the same. The armature is supported by bearings located at the open end of the magnet and the outer end of the shaft carries a small friction wheel which is held in proper contact with the side of the tire. The generator is supported in a bracket and so mounted that it can swing into and out of engagement with the motorcycle wheel. This motion is controlled by a small set screw opposing the action of a spring. When the set screw is released the spring presses the dynamo toward the wheel so that the friction wheel on the armature shaft comes in contact with the tire. In this position the dynamo generates current for lighting the lamp when the machine is being operated. For daylight running the dynamo is moved out of contact by the set screw device. It is held that sufficient current is supplied at a speed of 3.5 miles an hour and that there is no danger of burning out the lamp filament except when the machine is driven at excessively high and dangerous speeds for night driving. The bracket is well designed and constructed and the reflector is a true parabola, highly finished. The dynamo is very small, that fitted to bicycles weighing but three-quarters of a pound and the motorcycle type, two pounds. The contact of the friction wheel is so nicely regulated that the tire is not in any way injured. The same high grade material and workmanship characteristic of the Marburg products are incorporated.

Dyke's Bolted-On Boot.

A feature of Dyke's bolted-on outer boot is that it may be secured easily and quickly by the use of a screw driver and the shoe drawn up as tightly as desired. It is designed for reinforcing weak places in the tire or for covering blow-outs. The boot is 12 inches long, made like a tire and a feature claimed for

Schindler Signalling Gloves.

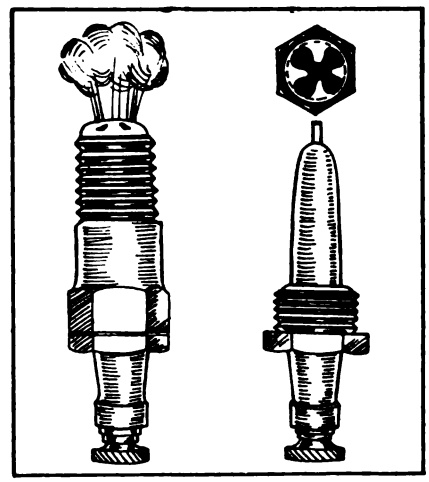
the device is that it will mend any kind of a blow-out or rim cut. The bead section of the



Digitized by Google

NEW ACCESSORIES

boot is fitted with steel rims carrying screws which are utilized to tighten adjustable clamps encircling the felloe. All metal parts are coated with a non-rusting material and the boot is sturdily constructed. It is made in five sizes and one of the advantages claimed for it in addition to quick attachment is that it will not creep.



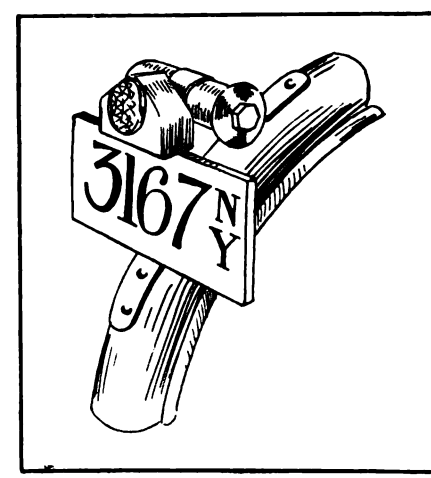
Schindler Signal Gloves.

A novel signalling device, constructed in two forms, has been brought out by Charles A. Schindler, 287 Palisade avenue, West Hoboken, N. J. One comprises a miniature ruby electric light which is fitted to a compact and neat pear shaped open metal frame and secured to the back of the glove. The switch members consist of two small copper terminals affixed to the tip of the thumb and index finger and when connection is made the bulb is lighted. The

Majestic Collapsible Spade.

second signal comprises a miniature electric bell, which is operated similarly to the device previously described. Current may be supplied by dry cells or a storage battery. The function

Mosler Ford Special Plug.



of the members is to signal vehicles approaching from the rear when the car is being slowed down, stopping or about to make a turn, the driver extending his arm in the usual manner and bringing the two terminals into contact.

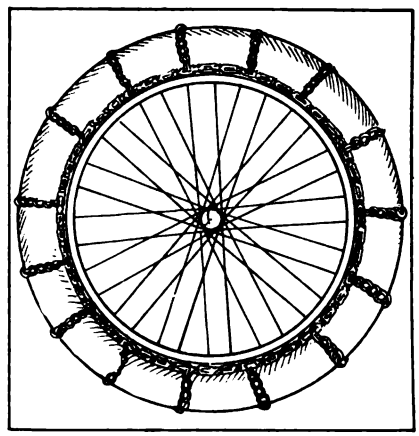
Majestic Automobile Spade.

Shovels are a necessary part of the car's equipment, especially when undertaking tours over poor roads. A collapsible spade is being marketed by the Waynesburg Pressed Steel Company, 120 White street, New York City. One of the qualities of the tool is that it may be taken apart and put together quickly, the handle fitting into a socket member integral with the spade proper and being secured by a threaded pin having a wing locking nut. The handle is of straight grained hickory, mission finished, with a malleable D iron and wood grip. The length of the spade assembled is 29 inches and the width 6.5, and when dismantled is 16.5 inches long and 6.5 wide. It is held that it will fit any tool box and comes in a neat package.

Mosler Ford Special Plug.

A. R. Mosler & Co., Mt. Vernon, N. Y., is manufacturing a spark plug especially designed for model T Ford automobiles, termed the four-leaf clover "good luck" plug. It is simply constructed and one of the qualities is that it may be taken apart easily and quickly for cleaning or inspection. The design of the electrodes is such that a number of sparking points are provided, preventing short circuiting, and iridium platinum prevents burning. The plug is constructed with a deep chamber which extends an inch above the cylinder gap so that the plug may be removed easily with an ordinary wrench without danger

Old Sol Electric Tail Light.



of injury. French gaskets are employed in the Mosler plug, making for gas tight joints.

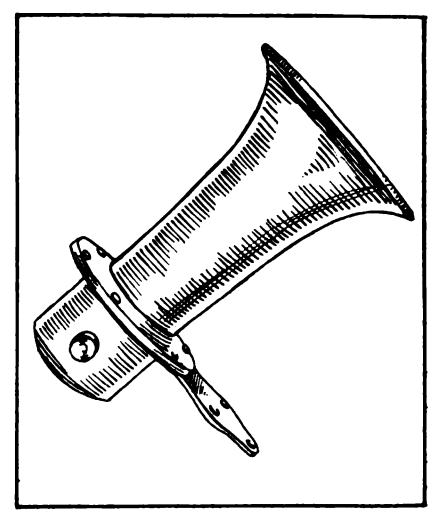
NEW ACCESSORIES

Weed Motorcycle Chains.

The fitting of larger tires and widening of the forks, both front and rear, by manufacturers of motorcycles, has made it possible to equip the shoes with the Weed anti-skid motorcycle chains. These members not only give perfect traction, preventing sliding and slipping, but have made riding in winter as safe as in the summer. One of the noticeable features of this product of the Weed Chain Tire Grip Company, New York City, is the patent locking device, which was designed especially for the motorcycle chain. It not only secures the ends of the chains together, but is fitted with a hook like attachment which makes it a simple matter to fit the chain. To put on the chain the rear wheel is raised by the stand, the ends of the chain hooked to the spokes, the wheel rotated and the free ends secured to the locking part. In demonstrations it has been attached in nine seconds on a 2.75-inch rear tire of a motorcycle. The chains are light, carried easily, and the side members are galvanized to prevent rusting. They come in a small brown canvas bag and being very compact may be carried in the tool box or coat pocket when not in service. They are made for the following size tires: Twenty-six by 2.5 inches, 28 by 2.5, 28 by 2.75, 29 by 2.75 and 28 by three. They are moderately priced.

Weed Motorcycle Chain.



A B Safety Tail Lamp.

Old Sol Electric Tail Light.

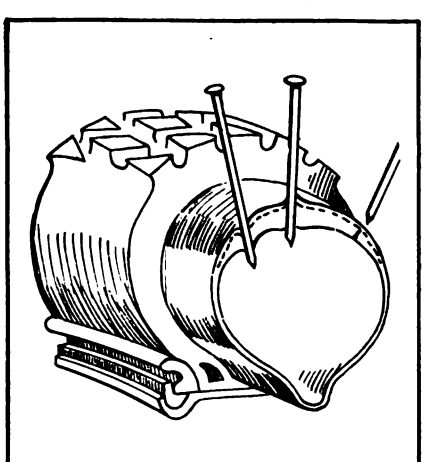
An electric tail light for motorcycles, weighing but 22 ounces, is being marketed by the Hawthorne Manufacturing Company, Inc., Bridgeport, Conn. It is a combination device, comprising a bracket for retaining the license number plate. The latter is illuminated by a white light. A red jewel on the head of the bracket member serves as the rear signal. The lamp is one candle power and it is stated that the dry cell battery will supply current about 25 hours. A specially designed bracket permits of detaching and using the lamp as an inspection member by replacing the ruby lens with a white glass. The tail light is moderately priced.

A B Safety Tail Light.

An electric tail light which possesses among other advantages that of showing plainly a red light from an angle of approach, is the A B safety tail lamp marketed by Chas. E. Miller, 97 Reade street, New York City. The device is constructed of heavy molded ruby glass, being spherical in shape and having a window of white glass for illuminating the license number. A metal base is incorporated for attachment, and is practically integral with the globe. The construction is water and dust proof and the bulb easily detached if desired. It is very compact and designed to withstand severe service. Being free from metal it is kept clean easily. The A B light is moderately priced. Provision is made for replacing the bulb, there being a standard base.

Clero Electric Horn.

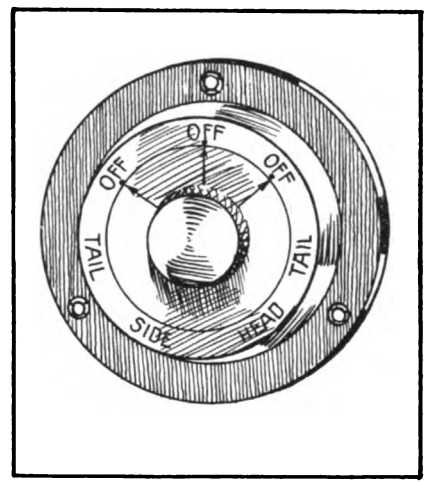
Digitized by Google



NEW ACCESSORIES

Clero Electric Horn.

The Fitzgerald Manufacturing Company, Torrington, Conn., has brought out a popular priced electric signalling horn which contains an ordinary electro-magnet which operates an armature on the well known make-and-break principle. This armature carries a tapper or hammer which vibrates at high speed against a steel diaphram, resulting in a loud, penetrating sound. The horn is constructed of high grade material, nicely finished and is operated by dry cells or a storage battery. The maker claims that it is dust, water and fool proof.



Brown Inner Tubes.

Self-closing when punctured is the feature emphasized in the Brown scientific inner tube, made by the Voorhees Rubber Manufacturing Company, Jersey City, N. J. It has a heavy tread and as it is manufactured is turned inside out, which

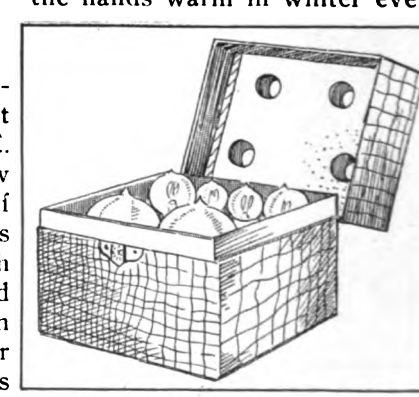
Brown Scientific Inner Tube.

places the excess material in the tread portion in compression. It is held firmly by a strip of canvas or fabric placed on the outside of the tube. When the tube is punctured the tread portion of

A B Three Point Switch.

the rubber, due to the compression under which it is placed, immediately squeezes together, preventing the escape of air. It is also held that the thickened portion of the tread makes for greater efficiency. The Brown tubes are made of Para rubber. C. J. Cross & Co., Inc., 1878 Broadway, New York City, is distributor.

A B Three Point Switch.



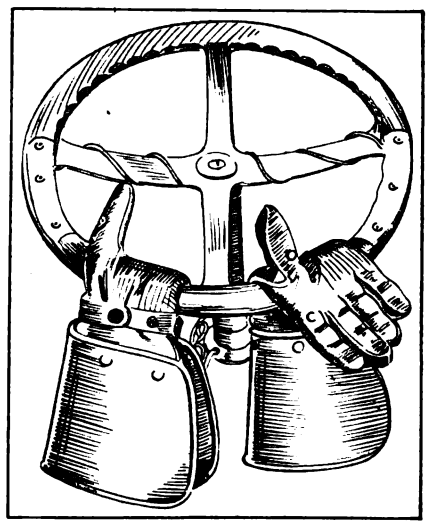
One of the qualities emphasized in the A B three point switch, marketed by Chas. E. Miller, 97-103 Reade street, New York City, is that the wiring of the car for electric lighting is simplified. The switch is a high grade water proof member and the controlling handle turns in either direction. It provides for the use of any group of lamps as desired. The switch is constructed of high grade material, nicely finished and is inexpensive. It is very compact.

Empire Mazda Lamps.

Empire Mazda electric lamps are manufactured by H. W. McCandless & Co., Inc., 69 Park Place, New York City, and are constructed especially for motor car service. The filaments are sturdy, being the latest improved drawn tungsten wire, and are mounted on bayonet or candelabra screw base unless otherwise specified. The company manufactures a large variety of sizes and shapes and makes a specialty of a lamp set which comprises six bulbs, or a road outfit. These are packed in a neat rattle proof box which may be carried in the tool box or other convenient place without fear of injury to the lamps. The set consists of two headlights, two side, a tail and speedometer lamp. The bulbs are designed for six or eight volts and the candle power varies from 1.5 for the speedometer lamp to 24 for the headlights.

Carron Electric Gloves.

Many drivers experience considerable difficulty in keeping the hands warm in winter even



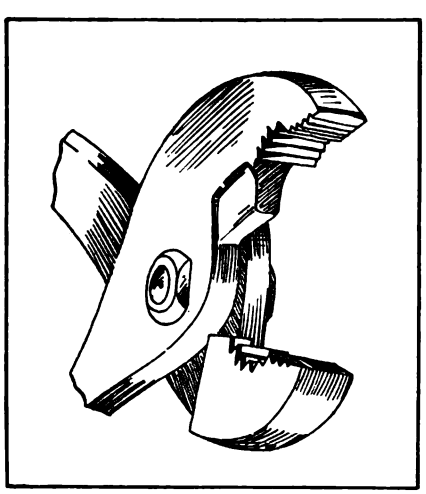
Empire Motor Car Lamp Set.

when wearing heavily lined gloves. Electrically heated gloves are being marketed by

Digitized by Google

NEW ACCESSORIES

Carron & Co., Inc., 1790 Broadway, New York City. They resemble an ordinary leather gauntlet, but concealed in their fabric and running in various directions throughout the soft wool lining are minute wire strands. Through these is transmitted an electric current. Attached to the thumb and index finger of each glove is a thin disc, connected to the wire strands. These discs come in contact with inconspicuous metal plates attached to the steering wheel to which are connected the wires from the storage battery or other suitable six-volt source of current. A regulator for controlling the amount of current and heat is provided. The gloves are of the best black leather with wrist strap and military cuff and are guaranteed. The outfit comes complete with small drill for attaching plates to rim of wheel, wires, connections, etc. The gloves are held to be as flexible as the ordinary members and current is utilized only when they are in contact with the metal plates. The heat is generated in the glove itself.

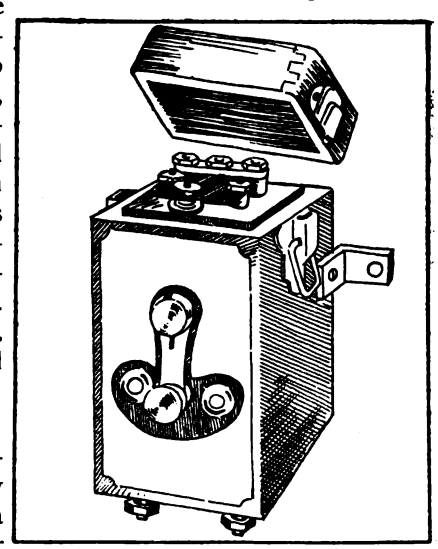


Carron Electric Gloves.

It is held that the gloves are economical of current.

McKaig Pliers.

Combination pliers termed the "sure cutters" are being manufactured by the McKaig Drop Forge Company, Buffalo, N. Y., and one of the noticeable qualities of the tool is that it will cut wire nails, etc., even when the bolt retaining the members is loose or the locking nut removed. This is due to the construction of the cutting jaws. The pliers are 7.5 inches long, constructed of drop forged steel and are moderately priced.



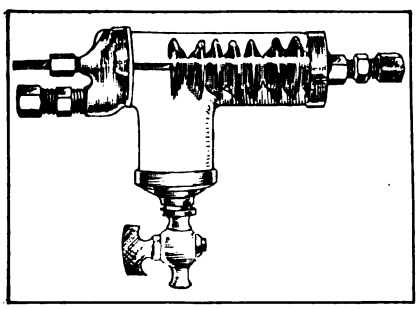
McKaig's Combination Pliers.

Ford Special Coil.

The New York Coil Company, 340 Pearl street, New York City, has brought out a new coil designed especially for model T Ford automobiles. It is a master vibrator, very compact, being six inches high, three wide and three thick. The case is mahogany, nicely finished and the switch lever provides two positions, one for the battery and the other for the magneto. Synchronization of the spark is secured through the use of the master vibrator, which is utilized in connection with the usual four unit coil, the vibrators of which are screwed down tight to render them inoperative. The wiring plan is very simple, requiring but the attaching of the magneto lead to the vibrator and running one short wire from the vibrator to the regular coil. The Ford special is moderately priced and guaranteed.

Perfect Gasoline Filter.

The Perfect gasoline filter, manufactured by the Gasoline Filter Company, 145 West 45th street, New York City, differs from those of conventional practise in that the filtering element of chamois is in the form of a bellows. Attached to the free end is a small rod which ex-



Ford Special Master Vibrator.

Digitized by Google

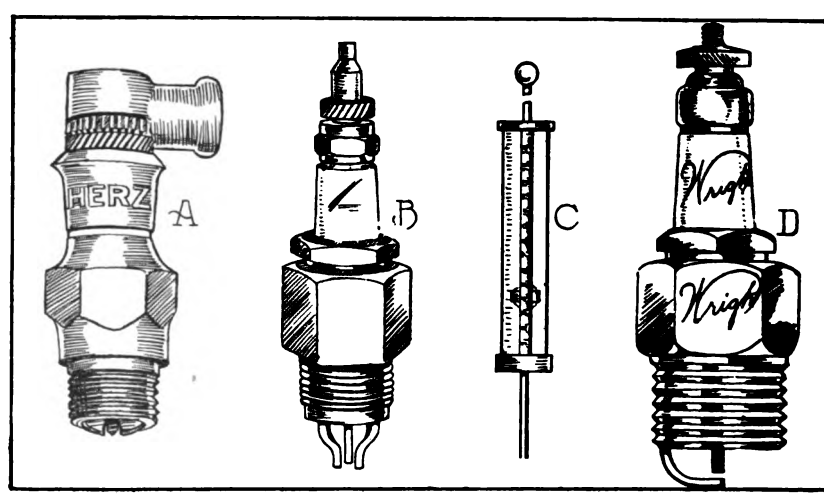
NEW ACCESSORIES

tends through the filter for the purpose of compressing and expanding the bellows, which

Perfect Gasoline Filter.

movements expel all fluid from their interior, flushing and cleansing them. The fuel enters at the lower inlet and passes through the fine chamois to an outlet to the pipe leading to the carburetor. All foreign elements, including water, fall to a reservoir fitted with a drain cock. The filter is easily installed in the main line as compression screw attachments are utilized in place of the usual soldering. A quality of the device is the fitting of an air vent screw at the top of the housing, and by removing this screw after installation any air in the line may be removed. All that is essential to fit the filter are a hacksaw and a small wrench. It is very compact, constructed of brass nicely nickeled and is moderately priced.

Herz Motorcycle Spark Plug.



Herz & Co., 295 Lafayette street, New York City, is marketing a new type of spark plug for motorcycles. It is constructed of what is held to be unbreakable stone having a taper seat, ground in carefully to fit, and the outside stone is so constructed as to prevent water or moisture creating short circuits. The insulated terminal is also weather proof and may be detached easily by unscrewing a thumb nut. The insulation is secured to a swivel joint, self-adjustable to the direction in which the cable is running and it is held that it cannot work loose. The centre electrode and four point disc are made of platinum alloy and the points are adjusted to permit of a strong spark at low and high motor speeds. A space between the inside stone and discs forms a combustion chamber which is held to provide self-cleaning features. It is made in metric, half-inch pipe, .875 inch and A. L. A. M. threads.

Wright Spark Plug.

The Wright spark plug is the product of the New York Mica & Manufacturing Company, Auburn, N. Y., that shown being of the porcelain type. It is of open end construction and the sparking points are a platinum alloy. It is claimed that the plug is adapted for either battery or magneto source of current and that the gap may be adjusted to meet requirements. High grade material, durability and non-sooting qualities are emphasized in the Wright plug, which is made in different threads. Stevens & Co., New York City, is distributor.

Essex Valve Timing Rod.

The S. B. R. Specialty Company, 17 Princeton street, East Orange, N. J., is marketing the Essex valve timing rod, which is a valuable addition to the tool equipment of either the repair shop or the private garage. By it the exact location of the piston may be determined accurately, making it possible to set valves and properly time the explosion in motors utilizing the make-and-break type of ignition, etc. The device is equipped with a calibrated scale showing inches in sixty-fourths, or millimeters. The rod is 16 inches long and the reversible scale is six inches. It is constructed of

Additional Accessories: A, Herz Motorcycle Spark Plug; B, Bethlehem Five Point Plug; C, Essex Valve Timing Rod; D, Wright Spark Plug.

Digitized by Google

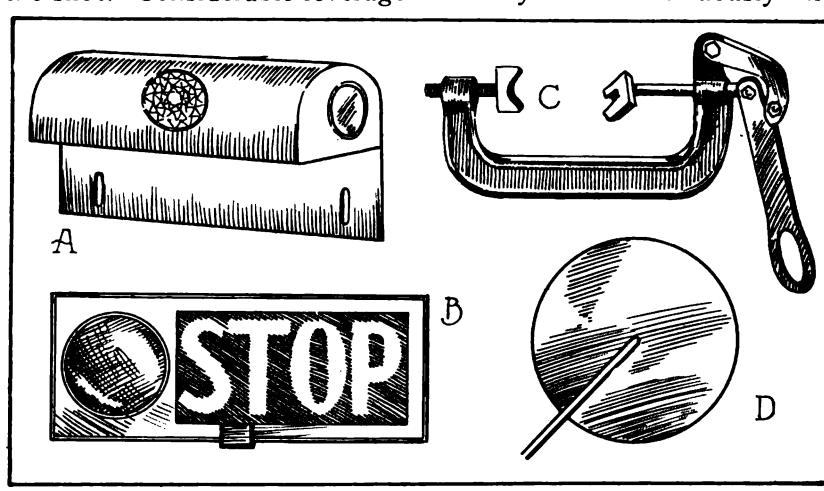
NEW ACCESSORIES

high grade material, very sturdy, and is nickel plated. It is moderately priced.

Bethlehem Spark Plug.

The Silvey Company, 60 Wall street, New York City, is marketing the Bethelehem five point spark plug, which is guaranteed against short circuiting even when the numerous points are covered with oil or grease. The sparking points are five in number and these extend some distance from the shell, a construction the maker claims makes for great motor efficiency, in that the flame takes place in the cylinder itself, not in the chamber of the plug. It is also held that the plug cannot be short circuited as the point that sparks burns the other points clean. A fine grade of German porcelain is employed and the shell is constructed of cold drawn steel. One of the features of the plug is the terminal cap, which may be employed as a gauge for setting the gaps.

Vesta Electric Tail Light.



The Vesta Accumulator Company, Chicago, has brought out a new electric tail light which is very compact and attractive in appearance. It comprises an enamelled hood member carrying a red, jewelled semaphore and a hooded white light for illuminating the license plate. Provision is made for the attachment of the number tag. It is moderately priced.

Bryant Tire Tool.

A tool for removing and replacing rims and tires, and one presenting a number of practical features, is the Bryant tire tool, manufactured by Stevens & Co., 375 Broadway, New York City. It is universal in that it will fit all styles and sizes of rims, and will remove and replace them with little exertion. It is equipped with tire and rim engaging devices, one carried by a slide shaft and the other on an adjustable screw, the latter being adapted for tires from four to six inches. The slide shaft passes through a guide hole and forces the wedge member downward into the bead, and it is held that it will not ride upward and injure the thin wall of the shoe. Considerable leverage is secured through the construction of the tool which, after forcing back the ring member, locks automatically. This enables the operator to use both hands in working on the rings, etc. One of the qualities emphasized is its adaptability for forcing the rusted bead of a shoe away from the inside of the rim and operating the tool from the outside of the wheel. The Bryant tire tool is compact, constructed of high grade material and is inexpensive.

Tobin Whichway Signal.

The Tobin Whichway Signal is a lamp designed for attachment to the rear of the machine and not only serves instead of the usual tail light, but also is a rear signalling device which is automatically lighted when the machine is slowed down or stopped. The lamp contains the usual red semaphore and in addition has an illuminated glass with the word "Stop" in three-inch letters in ground white glass on a red background. The bull's-eye is continuously illuminated by a tungsten bulb, while the other electric lamp lights the word whenever the car is slowed down or stopped. The control of the light is electrical and it may be fitted to the brake pedal or hand lever so that the application of this member lights the bulb. The maker points out that among its advantages in crowded traffic are: That the driver may maintain control of the car, that he is not obliged to extend his hand when stopping, and that the signal

Other Accessories: A, Vesta Electric Tail Light; B, Tobin Whichway Rear Signal; C, Bryant Tire Tool; D, Tobey Headlight Glare Remover.

Digitized by Google

can easily be seen by an approaching vehicle. The temporary office of the company is 30 Pine street, New York City.

Tobey Glare Remover.

In meeting approaching cars fitted with powerful headlights the glare is blinding, often compelling the driver to slow down or stop until the other machine has passed. A very compact and inexpensive headlight glare remover has been invented by William L. Tobey, 9 Lewis street, Boston, and a quality of the device is that it may be adjusted to any position and height on the windshield. It comprises an amber colored glass of suitable diameter carried by a nickeled tube which is secured by spring steel clamps to any type of windshield edge—round, square or plain glass. It may be attached to the middle bar when the top shield is down or to the top bar when the shield is up. It may be left in position or removed easily as desired. Normally the device is fitted in the centre of the windshield and upon the approach of a car the driver moves his head slightly and looks through the amber glass, which permits a clear vision of the road ahead, and without any dazzling effects. The headlight glaze remover is nicely finished and inexpensive.

In memory of Chester R. Lawrence of Los Angeles, Cal., the young journalist, who recently lost his life in company with Horace Kearney in an aeroplane accident, the J. I. Case Threshing Machine Company, Racine, Wis., maker of Case cars, has decided to place a tablet on the Ocean-to-Ocean highway, recalling the success attained by him in laying out the original route for the Atlantic-Pacific roadway, which eventually is expected to be the greatest automobile road in the world. Lawrence took charge of a Case car on its pathfinding trip from Los Angeles to New York City.

The Automobile Trade Credit Association met in New York City during the show and directors were elected. Suggested plans for prompt action to throttle the alleged fraudulent bankrupt evil which it was claimed had crept into the automobile industry, were considered. The directors elected were: F. A. Lemal, United States Tire Company; U. S. Kollie, American Ever Ready Company; William Oliver Turner, Lovell-McConnell Manufacturing Company; A. Waterman, Hartford Suspension Company; Abraham Barnes, N. Y. & N. J. Lubricating Company; John S. Martin, Martin-Evans Company. Franz Nelson was chosen counsel and secretary and his office at 80 Wall street designated as headquarters for the association.

Mrs. John Newton Cuneo failed to lower the world's speeding record for women at the Motor Parkway, Long Island, N. Y., owing to an accident to Louis Disbrow's 300 horsepower "Jay-Eye-See" car, in which she started. She then took another Case machine, made by the J. I. Case Threshing Machine Company, Racine, Wis., and made a half-mile in 0:18.4, or at the rate of 97.8 miles an hour. The record for a half-mile was made by Mrs. Cuneo in April, 1911, when she drove a Pope-Hartford car, made by the Pope Manufacturing Company, Hartford, Conn., in 0:16.1, or at the rate of 112 miles an hour.

Automobile manufacturers of the country will enter bids for the sale and rental to the Postoffice department, of 100 motor vehicles, suitable for rapid delivery of parcels in cities, Postmaster-General Hitchcock having announced that he would invite such tenders. All the vehicles will be painted red, in accordance with a plan to adopt this color for postoffice equipment in general. Prompt delivery of the new motors will be required as the numerous automobiles recently rented in preparation for the parcel post already are taxed to their utmost capacity, the volume of business having surpassed expectation. More than 4,000,000 packages were delivered in the United States during the first week of the operation of the law.

Jay Stevens of Grand Forks, N. D., has kept accurate record of his KisselKar six-cylinder car in travelling 11,200 miles. During that distance, Mr. Stevens used 975 gallons of gasoline, or an average of one gallon to every 11.5 miles, and with the exception of two pinion shafts and one pinion gear had no repairs.

Col. Henry M. Neil of Columbus, O., 81 years old and the oldest active driver in Ohio, if not in the country, was a guest of honor at the recent Cleveland Automobile Show. He purchased his first car in 1901 and since that time has driven his own machine every summer, touring thousands of miles. Besides covering the whole of Ohio he has toured in New York, Massachusetts, Rhode Island, Vermont, New Hampshire and Kentucky and some of the other eastern states.

THIRTEENTH ANNUAL CHICAGO SHOW.

EARLY in the history of the gasoline automobile Chicago began to play an important part in the development of the industry. Although the first practical machine of this type was constructed in the East, it remained for the Chicago Times-Herald race of Thanksgiving Day, 1892, to bring it most directly to the attention of the public. And while the first national automobile show was held in Madison Square Garden, New York City, Nov. 3-10, 1900, it antedated the first Coliseum display in Chicago by less than a month.

In March, 1900, Samuel A. Miles acquired his first motor car and about the same time he became an enthusiastic member of the Chicago Automobile Club. The side exhibit of motor vehicles in connection with the annual bicycle show in New York in 1899 had awakened the interest of manufacturers and others in the East, and it appears that Mr. Miles was convinced that something of this nature would appeal to the residents of the Middle West. The Chicago Automobile Club agreed to assist him in the enterprise and the Coliseum was engaged, but later in the year the club began to doubt the wisdom of the plan and Mr. Miles was left to bring the experiment to a conclusion as best he might.

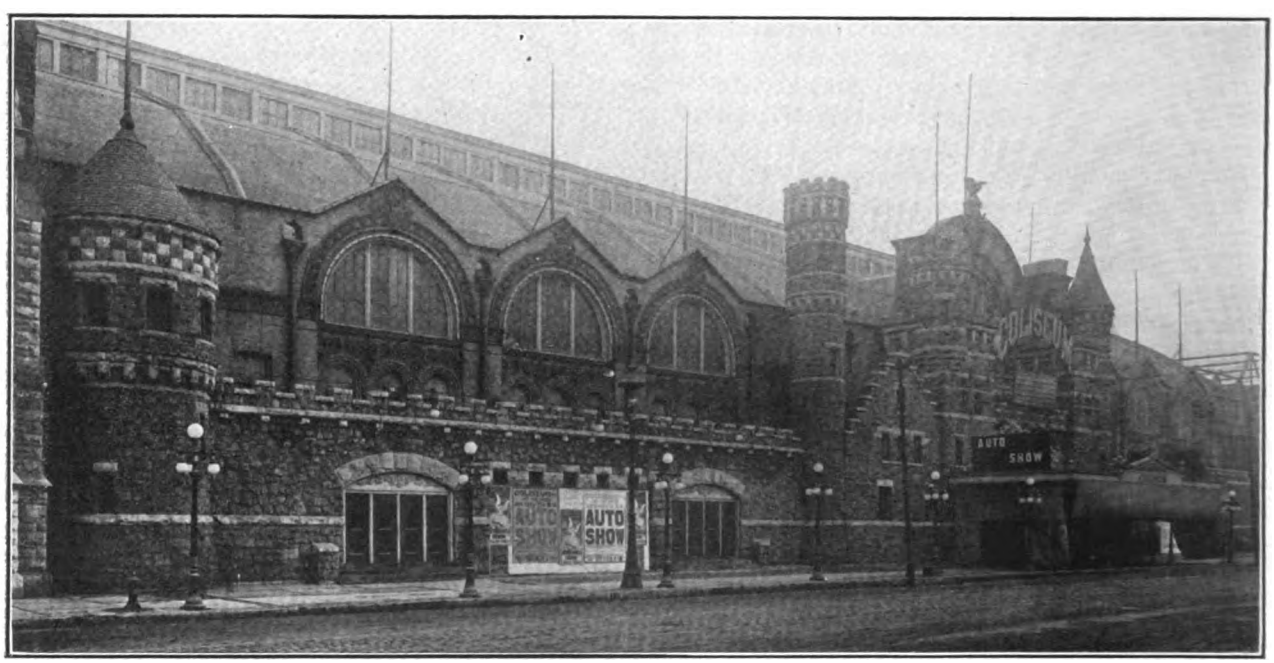
As was the case with the first national display in New York City, there was plenty of room available after all the exhibitors had been allotted all the space they would take. A demonstration track 18 feet wide took up some of this, and it was on this track that many of the most prominent motorists in Chicago today were permitted to enjoy their first ride.

How well Mr. Miles succeeded in his enterprise may be surmised from the fact that when the National Association of Automobile Manufacturers was organized he was selected as general manager. Since that time he has given his attention to the national displays in New York and Chicago, and the one event of this character in Atlanta, Ga., in 1909, but the Chicago show always has been his own personal success. The N. A. A. M. has usually acted as a sanctioning body only in connection with the New York displays, although in some instances Mr. Miles has assumed the direct management of at least one exhibition in that city.

The Chicago show has been distinct in many respects. While the two organizations of manufacturers, divided respecting their opinions of the so-called Selden patent, were holding separate displays in New York, Mr. Miles contended that the Chicago show must be representative of the entire industry. For this reason, while the list of exhibitors in Chicago has contained names of those who displayed at both shows in New York, there generally have been a number of additions—makers who did not exhibit at any display in the East. This will be true again this year, although not in such marked degree, because of the plan adopted by the Automobile Board of Trade which resulted in a more representative display in New York.

Only once in his long career as manager of the Chicago show has Mr. Miles been confronted with failure. That was in 1907, when it was decided to hold a separate showing of commercial vehicles in the Seventh Regiment Armory in connection with the pleasure car display in the Coliseum. So great was the demand for space from the makers of pleasure cars and accessories that it was deemed wise to make provision to accommodate other exhibitors. Interest in the business vehicle had only just begun to make itself manifest, and the experiment of segregating these proved to be premature. However, this one failure was turned into success, when Mr. Miles staged the first two weeks' display in 1910, with a showing of pleasure cars the first week and commercial vehicles the second. The first exhibition of this character was not attempted in New York until 1911.

Samuel A. Miles, Manager of the 13 Annual Chicago Shows.



This year the Chicago show will be held Feb. 1-15, the first period, Feb. 1-8, being devoted to pleasure cars and the second, Feb. 10-15, to commercial vehicles. Accessories will be displayed both weeks. Owing to the increased demand for space four buildings, instead of three, as in for-

Digitized by Google

mer years, will be utilized. The first shows were confined to the Coliseum. Later the Annex was added and still later the First Regiment Armory. This year the Wilson building, adjoining the Annex on the south, has been acquired for the overflow from these three structures.

Perhaps the chief respect in which the Chicago display has been more or less distinct lies in the general decoration scheme. The treatment has been rather more elaborate than in other cities. The idea has been to select a design which would harmonize in every detail and not detract from the inspection of the exhibits, and every effort has been made to present some completely new plan each season.

It has been the policy of the management to

Exterior of the Coliseum at Chicago, Which Has Been the Scene of Annual Automobile Shows Under Mr. Miles' Management Since 1900.

be conservative in its advance announcements concerning the decorations. Strangely enough the New York show management selected the same name for its Madison Square Garden setting as that which had been chosen for the Coliseum—the Crystal Palace. The treatment will be entirely dissimilar, however, since cathedral glass and stained window effects will be demonstrated there, instead of crystal.

The extremely ornate effects which have marked the centre of the Coliseum in the past will give way to a more imposing overhead treatment. Extending from side to side and from end to end, completely enveloping the roof, girders and every particle of the overhead construction, will be a large painting of which the principal feature will be 26 stained glass windows, each 22 feet square. Each window will be of separate design, in each instance a reproduction of some classic work of art.

The balcony front, a length of 1000 feet and to a depth of about 10 feet, will be treated similarly, but the pictures will be of rural scenes. There will be three of these in each of the 26 sections between the girders of the building. All of the pictures will be framed in massive settings, forming a scene at once impressive, dignified and pleasing.

Beneath the balcony the walls will be panelled in mahogany frames, enclosing plate glass mirrors. In addition to the walls and ceiling, mirrors will adorn massive posts erected below the balcony to disguise the iron girders which support the roof and gallery. Ornamental posts will mark the dividing lines between the exhibition spaces, and these will support clusters of perfectly white globes, electrically lighted. Somewhat similar posts will support the exhibitor's signs.

The Annex will be completely dressed in new material, one feature of which will be the mirrored panels of the posts and walls. The effect of these, as shown by experiment, will be to give the building an appearance of greater size, as well as to beautify the surroundings.

In the First Regiment armory, the lofty roof

Digitized by Google

will have the effect of having been lowered some 30 feet. Below this, all the balconies, except the first, will be hidden by painted draperies. The walls and ceiling will be dressed in panelled scenery and real flowers. Hanging baskets of flowers, each 10 feet in diameter, will be suspended over the centre of the floor, and below them, mounted on pillars similar to those in the Coliseum, will be ornamented globes and transparent signs, which also will form a feature of the decoration of the balcony front.

Chicago is the centre of a rich market for automobiles and accessories, and this market has been growing in decided proportions during the past few years. In some respects the situation is entirely unlike that which obtains in the East. While conditions in the cities will parallel those in any other section of the country, there still remains the large farming district of the Middle West which is utilizng motor vehicles of all types in ever increasing numbers. This undoubtedly accounts in no small measure for the fact that several makers always have made display at Chicago and at no other show.

The reason assigned for the failure of electric pleasure cars to make exhibit at New York this year was that no provision had been made for departmentalizing the display. This provision has been made at Chicago, and the electric pleasure cars will occupy the centre of the First Regiment armory. This fact has been borne in mind in the decorative treatment, as well. The electric is used very extensively in many of the middle western cities and this may be one of the reasons which impelled the management to make this special concession, but it also exemplifies the close study given by Mr. Miles to the needs of the various exhibitors.

It also was Mr. Miles who devised the plan whereby motor truck producers were afforded a better opportunity to get into close communication with the business men whose needs in this field were so diversified. Perhaps it was with his experience with the 1907 commercial exhibit in mind that Mr. Miles organized his system of personally inviting business men, municipal officials and others to visit the show and inspect the models on display. This plan was put into operation at the separate business wagon exhibit of 1910, and has been adopted by all large shows since that time.

The display of accessories will be quite as important as that at New York, several concerns who were not represented in the East having secured space at Chicago. A large number of these will remain throughout both weeks. Inasmuch as many of the new exhibitors are located in Chicago and the Middle West it is anticipated that several new accessories and fittings will be revealed at this time.

Among the exhibitors who were not represented at New York will be the following:

Gasoline Pleasure Cars.

Austin, Austin Automobile Co., Grand Rapids, Mich.
Colby, Colby Motor Car Co., Mason City, Ia.
Crow Elkhart, Crow Motor Car Co., Elkhart, Ind.
Glide, Bartholomew Co., Peoria, Ill.
Great Western, Great Western Auto Co., Peru, Ind.
McFarlan, McFarlan Motor Car Co., Connellsville, Ind.
McIntyre, W. H. McIntyre Co., Auburn, Ind.
Midland, Midland Motor Co., Chicago, Ill.
Pratt, Elkhart Carriage & Harness Co., Elkhart, Ind.
Staver, Staver Carriage Co., Chicago, Ill.

Electric Pleasure Cars.

Argo, Argo Electric Vehicle Co., Saginaw, Mich.
Baker, Baker Motor Vehicle Co., Cleveland, O.
Borland-Grannis, Borland-Grannis Co., Chicago, Ill.
Broc, Broc Electric Vehicle Co., Cleveland, O.
Century, Century Electric Car Co., Detroit, Mich.
Chicago, Chicago Electric Motor Car Co., Chicago, Ill.
Detroit, Anderson Electric Car Co., Detroit, Mich.
Ohio, Ohio Electric Vehicle Co., Toledo, O.
Rauch & Lang, Rauch & Lang Carriage Co., Cleveland, O.
Waverley, Waverley Co., Indianapolis, Ind.
Woods, Woods Motor Vehicle Co., Chicago, Ill.

Gasoline Business Vehicles.

Adams, Adams Bros. Co., Findlay, O.
Avery, Avery Co., Peoria, Ill.
Clark, Clark Delivery Car Co., Chicago, Ill.
Commerce, Commerce Motor Car Co., Detroit, Mich.
Durable Dayton, Dayton Auto Truck Co., Dayton, O.
Four Wheel Drive, Four Wheel Drive Auto Co., Clintonville, Wis.
Harder, Harder Motor Truck Co., Chicago, Ill.
Indiana, Harwood Barley Mfg. Co., Marion, Ind.
Jeffery, Thos. B. Jeffery Co., Kenosha, Wis.
Little Giant, Chicago Pneumatic Tool Co., Chicago, Ill.
Mogul, Mogul Motor Truck Co., Chicago, Ill.
Natco, National Motor Truck Co., Bay City, Mich.
Old Reliable, Old Reliable Motor Truck Co., Chicago, Ill.
Poyer, D. F. Poyer & Co., Menominee, Mich.
U. S., United States Motor Truck Co., Cincinnati, O.
Ware, Ware Motor Vehicle Co., St. Paul, Minn.

Electric Business Vehicles.

Urban, Kentucky Wagon Mfg. Co., Louisville, Ky.
Walker, Walker Vehicle Co., Chicago, Ill.

Accessory Exhibitors.

Arminger Chemical Co., Chicago, Ill.
Automatic Motor & Eng. Co., Chicago, Ill.
Auto Parts Mfg. Co., Muncie, Ind.
Barco Brass & Joint Co., Chicago, Ill.
Bowser & Co., S. F., Fort Wayne, Ind.
Breakstone, S., Chicago, Ill.
Continental Motor Mfg. Co., Muskegon, Mich.
Detroit Lubricator Co., Detroit, Mich.
Detroit Puncture Co., Detroit, Mich.
Economy Equipping Co., Chicago, Ill.
E. C. Sales Co., Chicago, Ill.
Edelman & Co., E., Chicago, Ill.
Empire Tire Co., Trenton, N. J.
Grip Nut Co., Chicago, Ill.
Halladay & Co., L. P., Chicago, Ill.
Ham Mfg. Co., C. F., Rochester, N. Y.
Harrow Spring Co., Milwaukee, Wis.
Highland Body Co., Elmwood, O.
Kokomo Electric Co., Kokomo, Ind.
Longdon-Brugger Co., Fon du Lac, Wis.
Michelin Tire Co., Milltown, N. J.
Morrison-Ricker Mfg. Co., Grinnell, Ia.
National Motor Supply Co., Cleveland, O.
Peck Wheel Co., Chicago, Ill.
Pittsburg Model Engine Co., Peru, Ind.
Racine Rubber Co., Racine, Wis.
Rutenber Motor Co., Marion, Ind.
Scott, Sample S., Chicago, Ill.
Tuthill Spring Co., Chicago, Ill.
Universal Tire Protector Co., Angola, Ind.
U. S. Ball Bearing Co., Oak Park, Ill.
Vanguard Mfg. Co., Joliet, Ill.
Waukesha Motor Co., Waukesha, Wis.

THE AUTOMOBILE JOURNAL

VOL. XXXIV. JANUARY 25, 1913. NO. 12.

Published the 10th and the 25th of Each Month.

William H. Black, Treasurer. D. O. Black, Jr., Secretary.

ADVERTISING DEPARTMENT:
NEW YORK—W. R. Blodgett, 25 W. 42nd St.
DETROIT—C. A. Eldredge, 304 Sun Building.
BOSTON—John W. Queen, 164 Federal Street.

Subscriptions:

The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Ten cents the copy.

Advertising Rates:

Information given at request. All advertising copy to insure publication must reach this office 10 days preceding the date of issue.

Remittances should be made by Check, Draft, Postoffice, Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.

Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

LOCAL VS. NATIONAL SHOWS.

There is some reason for believing that the automobile show situation in America has reached a point where the local display is to receive quite as much consideration on the part of the manufacturer as the so-called national exhibition. The experience of other nations has been such as to indicate that the annual show is necessary; that it has a stimulating effect upon business which is entirely beneficial. But conditions in the United States do not offer an exact parallel to those which obtain in France or England, for example.

It will be conceded that the Boston show always has been the largest exhibition of the year and that its effect upon the industry has been the most beneficial of all. Since its inception the Boston show has been known as a local display, managed by the dealers of that city. If success can be attained in such measure by the dealers in Boston, why is it not possible to secure similar results in other cities?

The manufacturer should be placed in a position where he can assist the dealer in making the local display of a character worthy of the industry in every way. This experiment is being tried this year, in a limited manner, by the inauguration of the national show circuit, sanctioned by the National Association of Automobile Manufacturers, under the terms of which the sales department is assisting local dealers as never before.

Because of the extension of the so-called minor show circuit to nearly every centre of importance in the country, the national show no longer attracts the prospective purchaser as in the earlier days of the industry. It is an open question with many manufacturers, whether or not the money expended in staging the national displays could not be utilized to much better advantage in reaching more people and in a manner productive of greater results.

The local show attracts the people whom the dealers know and creates a demand for information which can be supplied in the most advantageous manner. The same principles which have proven successful in Boston may be made to apply in the smallest centre, and with the same results, proportionately. And if a local show can be managed year after year in Boston, so as to be the largest and biggest business exhibition of the industry, there ought to be no reason why the dealers of New York and Chicago could not take up the work which has been carried on for so long by the manufacturers in those cities.

THE NEW YORK DISPLAY.

The 13th national automobile show in New York City was marked by increased interest in the motor starter, a surprisingly large number of wire wheels and the addition of many items as standard equipment. Two of these features had been anticipated, but the wire wheel situation was such as to call for special comment. Although several models were displayed, the essential features of which had been known for some months, there was sufficient that was new about many of the machines to hold and retain attention.

The accessory division was quite as interesting as any other, and because of the appearance of such fittings as standard equipment on the cars it may be conceded that the display made by these manufacturers was of undoubted importance. Several new lines were presented, some of

Digitized by Google

these being the product of well known makers in this field.

Concerning the exhibit of mechanical transports, it is not amiss to indicate that the business men of the East have had no better opportunity to inspect the various models and obtain exhaustive information. There would seem to be reason for believing that this portion of the show was of particular value from an educational standpoint, regardless of the amount of business transacted as a direct result of the display.

ELECTRICS AT CHICAGO.

The history of the Chicago show, as presented elsewhere in this issue, indicates that the management has taken advantage of every suggestion that would tend to benefit the industry in bringing its product to the attention of the prospective purchaser. In some instances, as was the case in 1907, subsequent events may have proven that the demand was not yet sufficiently developed to permit a successful launching of an innovation, but even in this case the ultimate result was such as to justify the experiment.

Perhaps the most noteworthy feature in the advance announcement this year is the provision made for electric pleasure cars. The importance of this branch of the industry may be better understood in the Middle West where conditions for their use are held to be ideal. This may explain in a measure the allotment of a prominent place in the First Regiment armory. The experiment will receive careful study by other show managers, since there should be no reason why other sections of the country should not offer a market quite as satisfactory as the Middle West. The more general adoption of electric commercial vehicles may be expected to draw attention to the pleasure cars, and all branches of the industry deserve the same measure of encouragement.

SELLING AUTOMOBILES ABROAD.

That the so-called American invasion has had its effect upon the sale of motor cars abroad is borne out by the fact that at least one concern has announced its intention of selling on the installment plan. Heretofore, foreign manufacturers have been content to maintain that good cars could not be produced for the money at which American machines were being sold. There does not appear to have been any previous effort to offset this advantage of price, although there has been some discussion of the possibilities for producing a cheaper grade of car to sell at a lower figure in competition with those of American manufacture.

Undoubtedly, the report of conditions in the United States made by Lord Montagu, editor of The Car, soon after his return from a visit to a number of manufacturing plants in this country, has had its effect upon the industry in Great Britain. Contrary to the opinion which other motoring publications sought to convey, Lord Montagu stated that American manufacturers were able to produce good cars and sell them for a little money.

Later in the year members of the British Institution of Automobile Engineers and the Society of Motor Manufacturers & Traders of Great Britain will be the guests of the American Society of Automobile Engineers. The programme of entertainment will include visits to a number of automobile factories in all sections of the country. These men will have ample opportunity to study, at first hand, business methods and constructional details which will place them in a position to judge more accurately the value of the American product.

INVITING THE MOTORIST.

Those who have given the matter of road construction even casual consideration cannot help but be impressed with the fact that many communities throughout the country are doing their utmost to secure better conditions in the hope that touring motorists may be induced to include these sections in their itinerary. There may be much reason for believing that methods of road making may be improved in many instances, but the desire manifested is in itself a hopeful sign that better conditions will prevail.

The situation indicates a decided change from that which marked the earlier days of the industry, when municipalities, and particularly suburban towns, seemed to be vying with one another in devising means by which automobilists should be restricted. The motorist owes it to himself and to these communities that he observe the proper spirit of co-operation. And for the most part it will be conceded that he is doing his share.

NOVEL SIGNALLING DEVICE.

A novel signalling device has been brought out by an English concern, the construction of which is of particular interest. By referring to the accompanying illustration it will be noted that a bell or gong member is secured to the radiator or frame inside the bonnet. It is pivotally mounted and is moved into contact with striking members affixed to the fan blades.

The strikers are lightly constructed and are

Novel Signalling Device Operated by Striker Arms Secured to Fan Blades.

secured by means of small nuts or screws as convenient. When the motor is operating and the fan consequently revolving the rollers on the arm come in contact with the edge of the gong, which is moved into position by a Bowden cable. The control member is located convenient to the driver.

It is said that a constant, penetrating but not unpleasant signal is produced. A stop member may be fitted and so adjusted that the bell is not allowed to move so far forward that it might be productive of stresses upon the fan blades. The location and construction could be altered to suit convenience of installation.

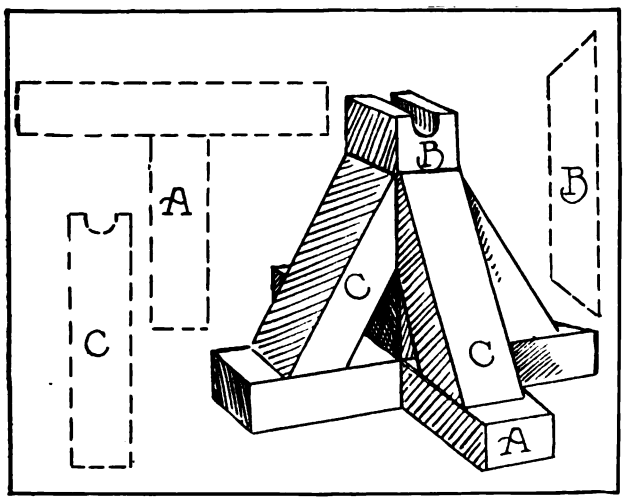
DRIVING GLOVES.

Some operators find it difficult to keep the hands warm on a cold day. Even with heavy fur gloves they complain of the cold. A suggestion contributed by a reader may prove valuable and being inexpensive is worth a trial. Purchase a pair of ordinary cotton gloves or mittens, costing about five cents a pair, and slip over these the usual gloves. It is said that the cotton lining is much warmer than any other material.

OPERATING MOTOR INSIDE.

Owners should be careful in running the motor for any great length of time in the garage, especially if it be a small building and no means are provided for ventilation. The exhaust contains poisonous gases and by inhaling these one is likely to be made seriously ill. If the engine must be run for any considerable period for making adjustments, etc., it should be done with the machine out of doors or with the windows or door open.

ACETYLENE TUBING.



With some types of generators more or less moisture forms in the tubing conveying the gas to the headlights and if the system is not provided with a trap for catching the fluid, considerable trouble will be experienced. Water in the piping is usually denoted by a flickering of the flame and a small blaze. Remove the tubing from time to time and blow out the water to prevent freezing and creating trouble when the service of the lights is most desired.

Digitized by Google

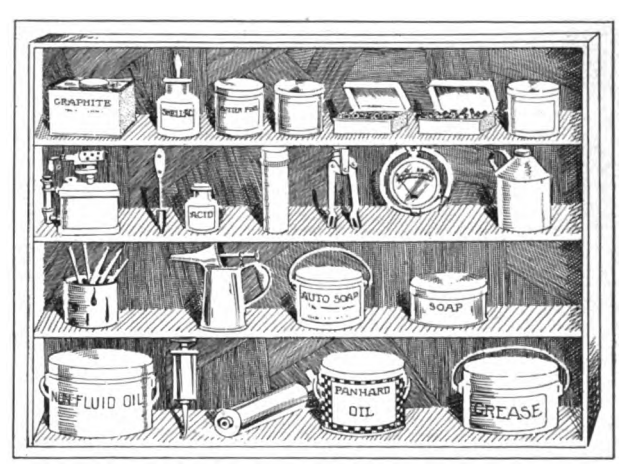
EQUIPPING THE PRIVATE GARAGE.

Part II.

While some types of motors may be lifted out of the frame by two persons, heavier units will require more, and when the motor, clutch and transmisson are of the unit construction, it is obvious that the work will need at least four.

Form of Home-Made Supports Constructed from Joist, Useful in the Garage.

The utilization of a chain hoist, especially of the differential type, will enable the removal of the power plant and the lowering of it to the motor stand or supporting member by one person. In locating the supporting hook for the hoist it should be placed in a substantial beam and in the most convenient position. This will depend upon the floor plan of the garage.



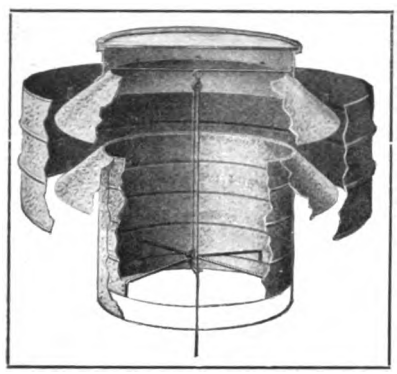
The ideal motor stand is one that permits of securing the engine to it so that its position may be reversed. This arrangement makes for decided convenience when working upon the bearings, etc., as adjustments may be made with comfort. Suitable stands may be constructed, however, from two-by-four joists, a type requiring but little knowledge of carpentry to build. One was shown in the previous installment, and the design makes for sturdiness and is not expensive. No dimensions are given because of the different designs of motors and their manner of suspension in the frame.

In planning the work the supporting arms of the motor should be measured carefully and the stand made so wide that when the engine is lifted out and set upon the side rails there will be sufficient room to permit of the use of a wrench in removing the lower half of the crankcase. The bolt holes of the arms should be in the centre of the supporting members of the stand and the power plant may be bolted down if desired by screw bolts, or holes may be drilled through the wood and bolts and washers utilized for fastening. In considering the height of the stand it should not be made too low for comfort as a backache will result from improper dimensions.

In the maintenance of the car as well as in its overhaul it is necessary to remove the front wheels to adjust and repack bearings with grease, and to perform a similar service for the rear members. While it is possible to employ an ordinary jack if the front axle is to be suspended for work upon the steering connections, etc., it is best to utilize a pair of supports. These should have a substantial base to prevent any movement of the car displacing them. When properly constructed they make for convenience in that one may work under the chassis with safety. They will also be of service when the machine is to be laid up for any length of time.

Making Axle Supports.

The supports may be made easily and in an accompanying illustration is shown a working plan utilizing two-by-four joists. Six pieces are required. The first step is to cut two members and fasten together as shown at A. The member B is recessed at one end as indicated and the wheels measured to provide for the proper height. This may be accomplished by measuring from the centre of the hub cap to the ground and adding about three inches so that the tires will clear the floor when the supports are in place.

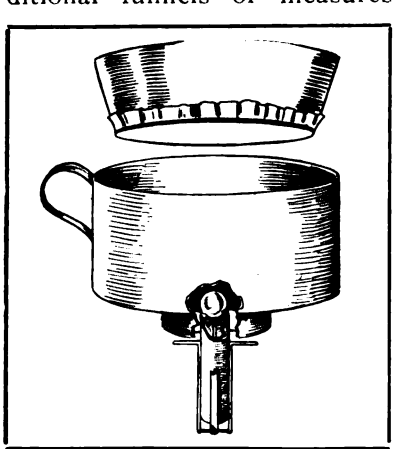


A Locker Having a Number of Shelves Is Handy for Storing Supplies and Small Parts Necessary in the Maintenance of the Motor Car.

Four of these supports are constructed, one

Digitized by Google

for each wheel, and when the chassis is raised from the floor they will facilitate the work around the steering gear, motor bearings, etc. It will be noted that the top of the support is recessed and the shape may be constructed so as to conform to that of the axle.



A Ventilator Should Be Fitted if Possible.

If the work of the overhaul is to be performed in cold weather and the garage is heated, it is an excellent idea to fit a ventilator to carry off the dangerous gases of the exhaust. The ventilator may be of the permanent or adjustable type. That shown in the accompanying illustration is specially adapted for garages and has a shutter which may be opened or closed as desired. With a ventilator it is a simple matter to regulate the supply of fresh air.

Funnels, Measures, Etc.

A good practical outfit of funnels, measures, etc., may be secured at a reasonable cost. One good oil funnel or measure is better than a number of cheap ones and in an accompanying illustration is presented a combination device. It serves for a funnel and measure and in addition has an automatic shut-off attachment. With one of these it would be unnecessary to purchase additional funnels or measures for the garage.

A Practical Fuel Funnel Is Invaluable.

A good fuel funnel is essential and while one may be made from an ordinary funnel and some chamois, that shown in an accompanying illustration possesses decided advantages over the home made type. With the latter considerable gasoline may be lost through underestimating the amount required to fill the tank, and spilling is not confined alone to the owner motorist. With the high price of motor fuel it is poor policy to waste. The funnel illustrated has an automatic shut-off and one of this type will save its cost in fuel lost in a very short time.

While the majority of owners purchase their soap for washing the car in pails or boxes and use these when cleaning the machine, much of the material is wasted by this method. The soap economizer pail depicted herewith is a useful device in that considerable soap is saved by its use and it also keeps the sponge clean. The soap is placed in the lower part of the pail and separated from the sponge by a perforated disc.

Those who maintain a private garage will purchase from time to time, as required, supplies and material for the upkeep of the machine and this is true of the motorist who has his repairs performed outside. If the work bench has a number of drawers much of the material may be stored in these, but in time the stock will be augmented by numerous small supplies such as shellac, packings, valve grinding compound, soldering flux, etc. These articles should not be allowed to litter up the work bench, necessitating their removal when work is to be done, but should be systematically placed so that when one or more are desired they may be secured easily.

A Good Funnel and Measure Are Essential to the Equipment and at Left Is a Combination Member—At Right Is Shown a Soap Holder Making for Economy.

When the building is being erected it is a simple matter to have the carpenter build a locker or cupboard and install a number of shelves. It need not be very wide nor very high, the dimensions depending upon the material to be stored. The locker should be located on the wall at one side of the work bench and a door having a lock may be fitted if desired.

Herewith is presented a plan of a locker and it will be noted that the various articles needed for the upkeep and overhaul of the machine are compactly arranged and handy for service.

(To Be Continued.)

CORRESPONDENCE WITH THE READER

Fitting Lighting Dynamo.

(1474)—Am seriously considering fitting a lighting dynamo to my car and wish to locate it on the transmission housing as there is not room on the motor because of several accessories such as the power tire pump, etc. Cannot the generator be driven off the clutchshaft by chain, belt or gears and how would the dynamo have to be geared? SUBSCRIBER.

Pensacola, Fla., Dec. 26.

The dynamo could be located as stated, although the majority of generators are mounted near the power plant and drive is taken from the crankshaft or camshaft. The method of installation and ratio of drive would depend upon the machine, the make of which was not given, and the dynamo. They are driven at varying speeds according to the design. Complete information will be forwarded upon request by the makers. In the Jan. 10 issue the different designs are described, and the addresses of manufacturers are given.

Heating the Mixture.

(1475)—Does heating the carburetor help any in starting a cold motor in cold weather? What is the difference between a high-tension magneto having a coil and one without? INFORMATION.

Paris, Ky., Jan. 1.

Heating the carburetor by water jacketing does not aid in starting, but when the heat from the exhaust is utilized starting is aided in that after the first few explosions warmed air is conveyed to the mixing chamber of the vaporizer.

A magneto may be of two types, namely, a low-tension in which the current generated is led to a coil and transformed into a high-tension, and the true high-tension in which the armature carries both the primary and secondary windings. With the latter type the low-tension current is converted into a high-tension by the instrument itself.

Functions of Charts.

(1476)—I notice from time to time a chart or diagram used in some of the articles appearing in your magazine, especially in connection with stories on electric lighting. The application is not clear to me. Why and what are they for? PUZZLED.

Sumter, N. C., Jan. 12.

The charts or diagrams referred to are utilized to illustrate the performance of the dynamo, for instance, and provide a compact and clear method of showing the characteristics of the machine. The lines or curves represent the actual performance at varying speeds, loads, etc., and any number of lines may be employed, depending upon what is to be shown.

A chart utilized in connection with a dynamo and for illustrating its output and the variation of the voltage of the battery, is depicted at Fig. 1, and an explanation of the curves will best illustrate the function of the particular chart. It will be noted that at the extreme left of the squares is a vertical row of figures with zero at the bottom and 13 at the top. These are marked amperes. At the right is another series of vertical figures, from zero to eight, and marked volts. The horizontal line of figures, starting with zero and ending with 3000, denotes the revolutions a minute of the dynamo. At the top of the chart, running from left to right, starting with zero and ending

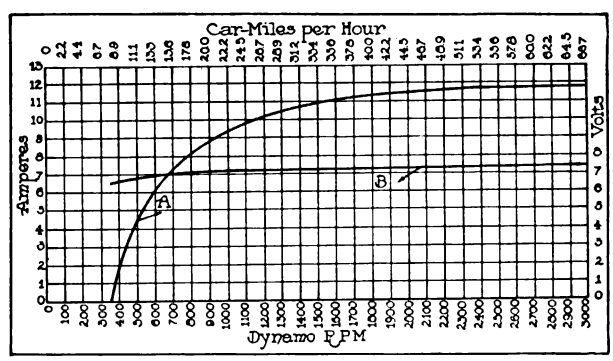

Fig. 1—Chart Utilized to Show Voltage and Current Curves of Dynamo Wound for 12 Amperes, Also Voltage Variation of Battery.

with 66.7, is the line representing the car speeds.

This chart is intended to show the voltage and current curves of a dynamo wound for 12 amperes, connected to a six-volt battery which is fully charged and not supplying current to the lamps, for example. It will be noted that there are two curves, one marked A and the second B. The former represents the current and speed characteristics of the dynamo with no current being drawn from the battery, although the cells are being charged by the generator.

This curve starts at the bottom of the chart between the figures 300 and 400. As these represent the speed of the dynamo, it is obvious that the current is cut-in at 350 revolutions a minute. As the output or amount of current of a generator increases proportionately to the speed, the number of amperes will increase correspondingly.

Digitized by Google

The line shows a gradual curve beginning at 350 and moving upward and to the right until the dynamo attains its maximum output of nearly 12 amperes at the highest point of the curve which is at about 2500 revolutions.

It is an easy matter to ascertain the number of amperes at any stated revolution above 375. For example: The output in amperes of the dynamo at 1000 revolutions a minute is desired; the 1000 mark on the lower horizontal line is located and followed upward vertically until the line intersects the curve, which in this instance would be slightly over nine. This shows the ampere output, and that for any speed may be determined similarly.

The upper horizontal row of figures shows the car speed corresponding to that of the dynamo. For example: If the output is 11 amperes and at 1500 revolutions a minute of the dynamo and the car speed is desired, find 1500 on the lower

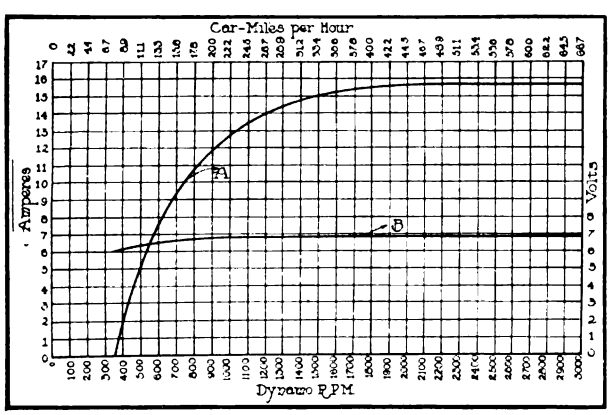

Fig. 2—This Chart Differs from That Presented at Fig. 1 in That the Output of the Generator Is 16 Amperes.

horizontal row and follow the vertical line to the top, where it will be seen that the car speed for this ratio is 33.4 miles an hour.

In this chart the engineer desires to show the voltage variation at the battery when the latter is being charged and the dynamo is operating over a range of from 350 revolutions a minute to 3000. This is represented by the curve lettered B and the volt column is at the right of the chart. At 350 revolutions, when the current is cut-in to the battery, the voltage is 6.5. This is seen by following the vertical row of figures at the left of chart. Beginning at 6.5 volts the rise of the curve is very gradual and slight, being but one volt from 350 to 3000 revolutions a minute. This demonstrates that the voltage is held steady, a point the engineer wishes to emphasize.

The chart shown at Fig. 2 is similar with the exception that it explains the action of a dynamo wound to generate 16 amperes. In connection with this drawing it will be noted that curve A represents the current and speed characteristics, while B shows the voltage at the battery as with the chart depicted at Fig. 1. Curve A of the second chart shows that the maximum output of the dynamo is attained at 2000 revolutions a minute and that it is held constant at higher and excessive ratios.

Charts may be utilized to show differences in temperatures, breaking point of material under different loads, etc.; in fact, they are usually employed by engineers as they give essential information in a very compact and comprehensive manner. Any number of lines or curves may be utilized, depending upon the subject.

Difficulty in Starting.

(1477)—I have a model T Ford which is difficult to start. Sometimes it will start easy and then again hard, and under the same conditions. The agent states that the trouble is due to the timer connections being worn and to lost motion thereof. Will you inform me if this is correct and how the trouble may be remedied?

INFORMATION.

Nashua, N. H., Jan. 20.

The agent probably is correct, and his statement could be verified easily by rotating the timer to ascertain the amount of lost motion in the linkage. It will be noted that the spark lever rod at the bottom of the steering column carries a bell crank to which is secured a ball and socket joint, and that the latter is connected to the timer by a rod. In time these ball and socket members will wear and very often the lost motion is due to inattention, such as allowing dirt to accumulate and not lubricating the part.

If the cover to the timer is removed and the motor cranked it will be seen that the roller contact member rotates to the left or anti-clockwise. If there were any lost motion in the linkage, the roller would have a tendency to move the timer to the left, retarding the spark, and consequently causing a later explosion of the mixture.

Assuming that the timer were originally set so that the spark took place after the piston had begun its downward movement of the firing stroke, and it were still further retarded by the lost motion in the linkage, it will be seen that the value of the compression would be decreased. Consequently if the mixture be thin or slow burning, the piston would be well down on the stroke before there would be opportunity for the gas to become properly ignited. These conditions make for difficult starting.

While the spark lever may be advanced to offset the lost motion in the timer linkage, it is not recommended. A better plan would be to eliminate the play by fitting a new ball and socket joint and resetting the timer as it was originally.

Digitized by Google

Relative to starting: A rich mixture should be employed, and after the motor has become warm the amount of fuel may be cut down by the dash adjustment.

SPECIAL BOSCH SHOW.

Car and Motorcycle Manufacturers Also Assist in Distributing Literature.

Because the Bosch Magneto Company, New York City, maker of Bosch magnetos and plugs, was unable to secure sufficient space in which to display its products, this company was not represented at either Madison Square Garden or Grand Central Palace. Instead it had a special show of its own at 223-225 West 46th street, where those who desired to become familiar with the different types of Bosch ignition were met by engineers and technical men.

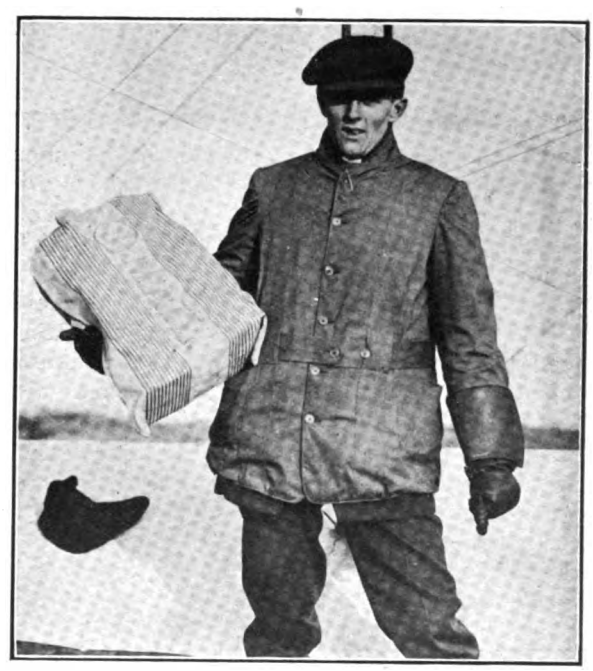
In addition, 146,000 special booklets, each descriptive of the Bosch magneto used by the manufacturer on his product, were distributed by car and motorcycle makers at the regular show. These booklets were particularly valuable, because of their special application to the individual make of car or mount, and while the work of publication called for the preparation of a large amount of text, the Bosch company was assisted very materially by the considerable number of manufacturers who employ Bosch ignition.

SAN DIEGO ROAD RACE.

Mercer Finishes Second Behind High Powered Fiat Machine Over Severe Course.

At the recent annual road race at San Diego, Cal., a Mercer machine, made by the Mercer Automobile Company, Trenton, N. J., finished second, first place being taken by a 120 horsepower Fiat car. The contest took the cars over narrow mountain roads and was reported as being one of the most difficult courses ever used in the West for automobile speeding.

On the straight roads the Mercer made 83 miles an hour, and despite the severe requirements it finished in perfect condition. Other cars in the race were two Benz machines, one driven by Robert Burman; three Nationals, two Stutz cars, three Buicks and one Columbia.



According to H. G. Hargreaves, sales manager of the Southwest Motor Company, Kansas City, Mo., of the 100 Rauch & Lang electrics in that city, 95 per cent. utilize Motz cushion tires.

AERIAL PARCEL POST.

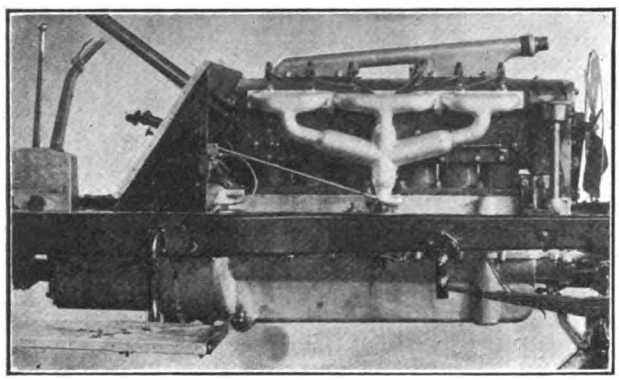
Aviator Jones Utilizing Burgess-Wright Biplane for Delivery of Baked Beans.

The first aerial parcel post flight was accomplished Jan. 13, by Harry M. Jones of Providence, R. I., in a Burgess-Wright biplane. Jones left Boston at 2:12 in the afternoon and arrived in Providence, R. I., at 3:05, having made the 48 miles in 53 minutes. This was the first leg in a cross country flight from Boston to New York.

Jones is a Providence boy, who until last year rode a Flying Merkel motorcycle with much success on road and track. He began the study of aviation last summer, and recently made a flight

Harry M. Jones, Providence, R. I., with the First Aerial Parcel Post Mail Bag.

from his home city to Boston, alighting on the Common, a feat which many more experienced aviators had declined to undertake.

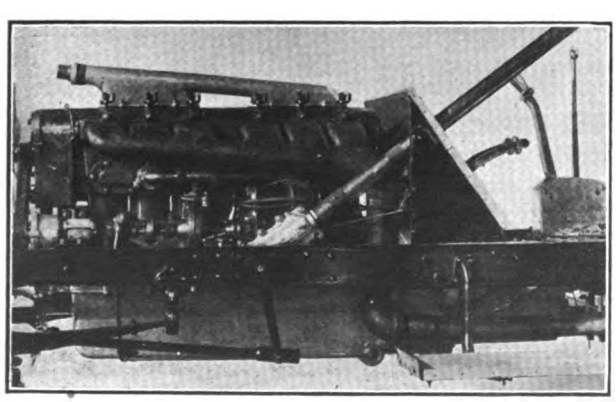


Early in the present year Jones was sworn in as a United States mail carrier for the purpose of establishing the first aerial parcel post route between Boston and New York, as an experiment. Boston baked beans were selected for the packages.

The first stage of the trip was accomplished without mishap, although the weather was extremely cold. In some places the air was found to be decidedly treacherous, but the entire flight was made without alighting. At times it was found necessary to reach an altitude of 4000 feet.

Digitized by Google

SPEEDWELL-MEAD ROTARY VALVE MOTOR.

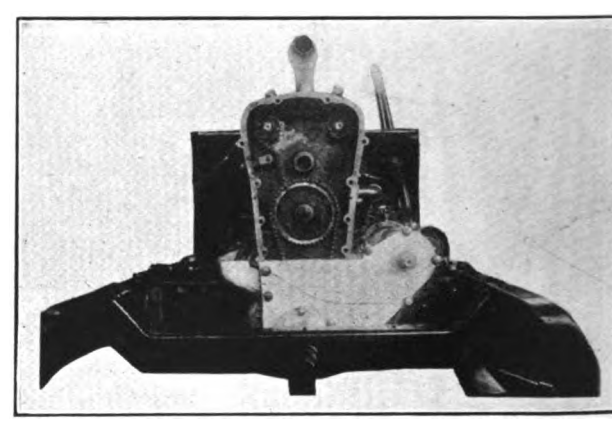


ADMITTING that the question of poppet vs. non-poppet valve motors is one which is still far from being settled, the adoption of the

Exhaust Side of Speedwell-Mead Rotary Valve Engine.

Mead rotary valve engine as standard equipment by the Speedwell Motor Car Company, Dayton, O., was one of the chief features of the New York show, where a car utilizing this motor was exhibited for the first time. It will be noted that the Speedwell company does not attempt to decide the question definitely, one way or the other, since the new six-cylinder model offers an option of either the regulation Speedwell poppet valve motor or the new rotary valve design.

The Mead engine is not new. It has been undergoing experimentation for the past two years, at least, automobile manufacturers have been investigating its merits for that length of time. It has been subjected to all manner of tests in cars of various makes, having been run several

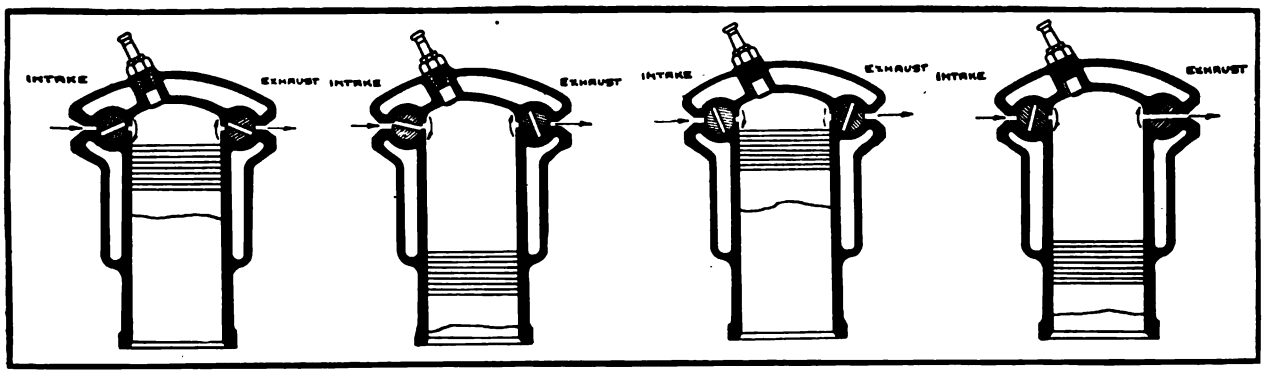


Inlet Side of Speedwell-Mead Rotary Valve Engine.

hundred thousand miles. The results have been such as to indicate that it is a thoroughly satisfactory product in every respect, and it hardly will be contended that it is now in any way an experimental proposition. Its adoption by the Speedwell company is sufficient recommendation of its practicability.

It is assumed in this instance that interest in the new Speedwell car centres upon this motor, although it may be stated that other features of design and construction are well worth careful consideration. The Speedwell-Mead engine probably was not overlooked by many visitors at the show, and it must be conceded that it will attract attention wherever it is demonstrated.

Accompanying illustrations bring out its features, with the exception of the valve itself. That consists of a cylinder 1.625 inches in diameter, in two parts, connected by an Oldham coupling. In this cylinder there are six valves or valve openings, which are milled 3.875 inches long, or near-



Valve Driving Mechanism on Speedwell-Mead Motor.

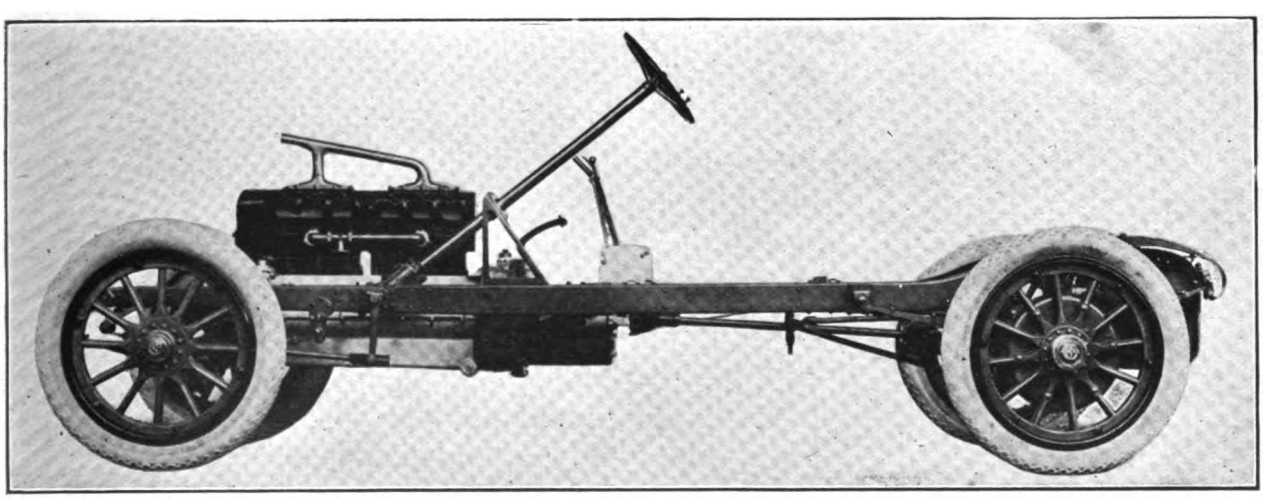
ly to the diameter of the combustion chambers of the motor. There are two distinct valves, one for the intake and the other for the exhaust, and these are exactly alike except for the width of the slots, these being .375 inch for the intake and .421 for the exhaust.

These valves rotate continuously in one direction at one-quarter crankshaft speed. The method of drive is shown herewith, this being by silent chain. The valve drive sprocket is carried on a hardened steel bearing, through the centre of which a stud extends, and the valve is driven by dogs which are fastened to the sprocket. It is maintained that either end of the valve may be removed for inspection and replaced without affecting the timing in any manner. The construction of the coupling takes care of alignment, and as the intake or exhaust passes directly through the slots in either direction there is held to

Digitized by Google

Cross Sectional View Indicating Cycle of Operations with Rotary Valve Motor Utilized in New Speedwell Six-Cylinder Car.

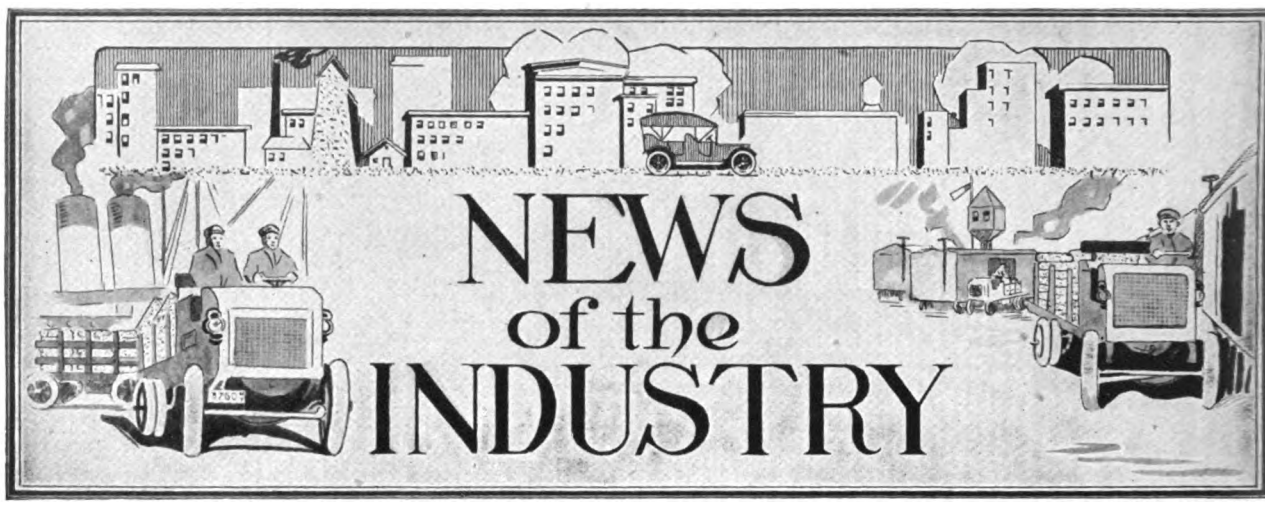
be no possibility of error in reassembling.



It is maintained that any timing that may be obtained on a poppet valve engine may be secured with this construction, since it becomes merely a matter of valve diameter and slot width. The timing actually used is as follows: Intake opens 10 degrees after upper dead centre and closes 30 degrees past lower dead centre; exhaust opens 50 degrees before lower dead centre and closes five degrees after upper dead centre.

Accompanying sectional drawings show the cycle of operations. From left to right the strokes are: Induction, compression, explosion and exhaust. The arrows within the cylinders indicate the direction of valve rotation, while those outside show the flow of gases.

Views of the intake and exhaust sides present the exterior of the motor, which has the same bore and stroke as the regular Speedwell poppet valve engine—4.125 by 5.25 inches. The chassis view is of the exhaust side with the manifold removed, and the valve may be seen through the exhaust ports. This also indicates the balance of the chassis construction, which has the same three point suspension of power plant, dry disc clutch and transmission bolted to the crankcase, which fully encloses the flywheel, as with the poppet valve motor.



An order for seven Buick cars, made by the Buick Motor Company, Flint, Mich., was recently filed with Manager J. W. Atwood of the Dallas, Tex., branch, by J. Isling of Fort Worth, Tex. The cars were for immediate delivery and business men in the neighborhood of the Buick offices volunteered to drive them to the sister city, resulting in a pleasant auto party.

Lieut. Theodore Metcalfe, a British army officer, recently created a new record from Brisbane to Toowoomba, Australia, in a Hudson car made by the Hudson Motor Car Company, Detroit, covering the distance of 90 miles in 3:17:00, which is 1:13:00 better than any previous performance. The run was official, being held under the direction of the Brisbane Automobile Club.

APPROVE CONSOLIDATION PLAN.

Two Organizations Will Unite to Form Automobile Chamber of Commerce.

The proposed amalgamation of the Automobile Board of Trade and the National Association of Automobile Manufacturers, which has been under discussion practically all of the past year, was brought to a definite head at the annual meeting of the former organization in New York during the progress of the pleasure car show. The report of the consolidation committee was accepted, nearly all of the 65 members of the Automobile Board of Trade being present and the vote being unanimous. It is understood that the executive committee of the National Association of Automobile Manufacturers has accepted the report for the members of that organization.

Under the terms of the report the amalgamated association will be known as the Automobile Chamber of Commerce, and will start its existence with some 110 manufacturers. It does not appear clear whether the two older organizations are to lose their identity, but the new association will act in all matters affecting the united industry.

The Automobile Board of Trade has re-elected its old board of officers and directors as follows: President, Charles Clifton; vice president, C. C. Hanch; secretary, R. D. Chapin; treasurer, George Pope; general manager, H. A. Bonnell; directors, Charles Clifton, Pierce-Arrow Motor Car Company; C. C. Hanch, Nordyke & Marmon Company; S. T. Davis, Jr., Locomobile Company of America; Hugh Chalmers, Chalmers Motor Company; S. D. Waldon, Packard Motor Car Company; Wilfred C. Leland, Cadillac Motor Car Company; John N. Willys, Willys-Overland Company.

HEADS DURABLE COMPANY.

Former Member of Oakland Purchasing Department to Manufacture Leather Supplies.

Frank Bauer and P. M. Lewis, both well known in Detroit automobile circles, have purchased the stock formerly held by L. A. Young in the Durable Company. Under the new owners the concern will continue the manufacturing of automobile top straps, magneto boots, cross-arm boots and other leather supplies.

The new officers of the company are: President, Frank Bauer; vice president, F. O'Brien; secretary-treasurer, P. M. Lewis. Mr. Lewis, under the former management was secretary and general manager of the concern. Mr. Bauer left the purchasing department of the Oakland Motor Car Company, Detroit, maker of Oakland cars, to accept the presidency of the Durable Company.

BECOMES CHIEF ENGINEER.

W. B. Engler Wins Promotion After Studying Truck Conditions in European Cities.

Announcement has been made by W. L. Day, vice president of General Motors Truck Company, Detroit, maker of G. M. C. trucks, of the promotion of W. B. Engler to the post of chief engineer with entire charge of experimental and development work. Preparatory to his new and larger responsibilities, Mr. Engler has passed the last three months abroad studying truck design as well as conditions surrounding motor truck

Digitized by Google

service and operation in various European cities.

For the past three years Mr. Engler has been head of the engineering department of the General Motors Company's heavy duty gasoline truck plant at Owosso and previous to that was associated with the Olds Gas Power Company of Lansing, Mich.

TO MANUFACTURE BODIES.

Los Angeles Concern Increases Facilities to Meet Additional Demand for Product.

The Kribs Auto Works, Los Angeles, Cal., has just installed several of the largest and most modern machines used in building automobile bodies and this department has been put in charge of a corps of experts. The company is now established in its new place of business on 10th street and is prepared to handle all kinds of automobile work.

The heaviest demand recently has been for painting and the building of fore doors on old models. A large number of orders are also being received for truck and delivery car bodies. Many of the trucks sold in Los Angeles and vicinity are without bodies, the merchants preferring to have special designs built to order, a practise which has resulted in increased business for the Kribs Auto Works.

NEW HENDERSON SIX.

Announcement Coincident with Resignation of C. S. Ricker as Chief Engineer.

Chester S. Ricker has resigned as chief engineer of the Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars. In connection with the announcement is the interesting news that a new Henderson six-cylinder model will make its appearance in the near future, carrying a motor of special design, largely the handiwork of Mr. Ricker. Hitherto the Henderson company has manufactured only a four-cylinder car.

In commenting upon his proposed change Mr. Ricker explains that his connection with the Henderson company was largely due to his intimacy with the Henderson brothers, and the opportunity afforded to design a popular priced car embodying the features that in his judgment would represent the trend of the automobile trade. Mr. Ricker will continue as a stockholder of the firm and also remains a member of the board of engineers in an advisory capacity.

HONORS AUTOMOBILE INDUSTRY.

Selection of C. C. Hanch as Head of New Indianapolis Chamber of Commerce.

The election of C. C. Hanch, treasurer of the Nordyke & Marmon Company, Indianapolis, maker of Marmon cars, as the first president of the recently organized Indianapolis Chamber of Commerce, is not only an honor to himself, but to the entire automobile industry. The new association results from the consolidation of six of the commercial and civic bodies in the city.

Mr. Hanch is well known throughout the industry, aside from his connection with the Nordyke & Marmon Company. He is at present vice president and one of the directors of the Automobile Board of Trade and in addition he holds the important position of chairman of the patent committee. He formerly was vice president for Indiana in the National Association of American Manufacturers.

C. C. Hanch, President, Indianapolis Chamber of Commerce.

The new chamber of commerce will have charge of all public movements for the bettering of business, civic and social conditions in Indianapolis, and since motor car manufacturing plays such a prominent part in the industrial activity of that city it is eminently fitting that an automobile man should be selected for its first president.

SOMERVELL FOR HERRESHOFF.

Becomes General Manager with Intimate Knowledge of Production and Salesmanship.

The Herreshoff Motor Company has announced the appointment of C. Stuart Somervell as general manager of that company. Mr. Somervell until recently was manager of the Lycom-

Digitized by Google

ing Foundry & Machine Company of Williamsport, Penn., automobile motor manufacturer, which business he established in those works. Among his other duties he personally attended to the sale of the factory output.

Mr. Somervell for the past three years has been in close touch with the automobile situation. He is a man of energetic personality and has had wide experience in the production and sales departments of various factory organizations. His knowledge has been gained through long years of the very best schooling and knowing, as he does, so intimately and in detail the production and sales departments of the manufacturing business, his appointment is a distinct gain to the organization of the Herreshoff Motor Company.

TO REFINANCE LEXINGTON.

Connersville Company Offers Proposition to Satisfy Creditors and Enable Production.

The Connersville Securities, Connersville, Ind., a corporation composed of local capitalists, has offered the creditors of the Lexington Motor Car Company a proposition to purchase the claims against the company and to refinance it on a sound basis. The proposition is for 25 per cent. in cash 30 days after proper delivery.

The difficulty of the Lexington Motor Car Company arose from the failure to secure new capital after entering into a contract to produce cars worth $1,500,000 a year. A meeting of the creditors was called and a committee appointed. Nominal assets are placed at $134,000 and liabilities at $140,000.

EMPIRE TIRE REORGANIZATION.

Two Older Concerns Combine with Increased Capital and Facilities for Production.

The Empire Tire Company and the Empire Rubber Manufacturing Company, both of Trenton, N. J., and controlled practically by the same individuals, have been combined under a new organization to be known as the Empire Tire & Rubber Company. The capitalization of the new concern is $1,000,000, of which $500,000 is preferred stock and the other half common. This represents an increase of $450,000 over the capitalization of the former companies.

There has been no material change in the official personnel of the concern. C. Edward Murphy will continue to direct the affairs as treasurer and general manager. The other officers are: President, Charles H. Baker; vice president, J. Cornell Murray; secretary, A. Boyd Cornell.

LION PROPERTY SOLD.

Chicago Concern Files Bid Which Proves Acceptable After Week's Delay.

According to advices from Adrian, Mich., the property of the Lion Motor Car Company of that city, which met with reverses shortly after the destruction of its plant by fire early last year, has been sold to Samuel Winternitz & Co., Chicago, for $13,000. The appraised value is understood to have been $33,000.

The bids were opened by Lee E. Joslyn, referee in bankruptcy, the largest being $7000, and the sale was postponed one week, in view of the discrepancy between the highest bid and the appraised valuation. In the meantime the Strong, Carlisle & Hammond Company of Cleveland, O., entered the lists, with the result that the price was advanced to $13,000.

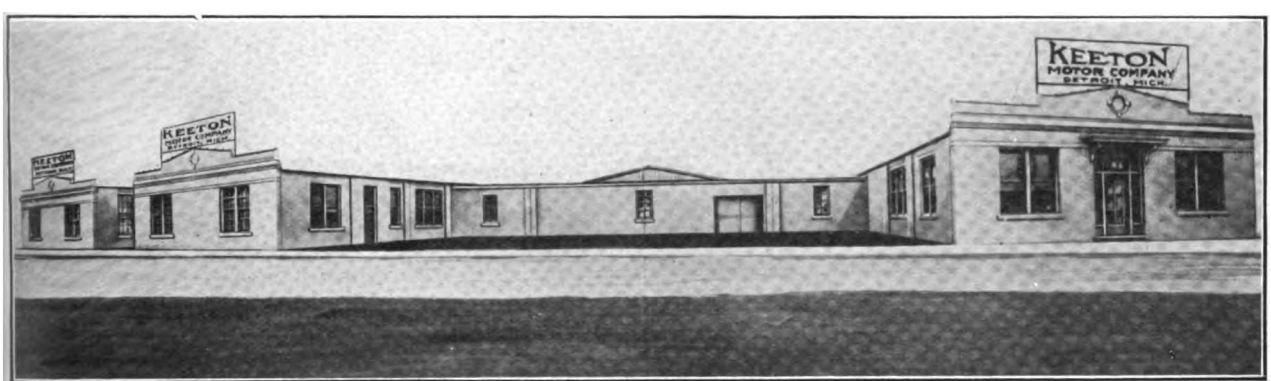
R-C-H OFFICERS ELECTED.

J. F. Hartz Becomes President and R. C. Hupp Is Vice President.

At the annual meeting of the board of directors of the R-C-H Corporation, Detroit, maker of R-C-H cars, held at the plant, the following officers were elected: President and treasurer, J. F. Hartz; vice president, R. C. Hupp; secretary, C. P. Seider. These officers, with G. W. Rogers and J. G. Robertson, Akron, O.; John Kelsey and Joseph H. Clark, Detroit; G. Jahn of New York City and C. G. McCutcheon of Jackson, Mich., comprise the directorate. Mr. Jahn was elected to succeed F. M. Randall of Detroit, who resigned.

The new president of the company, J. F. Hartz, is one of the best known and most successful business men of Michigan. He is president of the C. M. Hall Lamp Company, vice president of the Williams Bros. Company, president of the J. F. Hartz Company and interested in many other successful and well known Detroit concerns. Arrangements have been completed for ample financial backing for the R-C-H Corporation and plans made for an energetic sales campaign for the coming season.

As previously announced, Peyton R. Janney, formerly of the General Motors Company, and



Digitized by Google

with a splendid record both in the manufacturing and sales departments of the automobile business, became general manager of the company Jan. 1. Fred R. Bump continues as assistant general manager.

SECURES NEW FACTORY.

Keeton Motor Company Acquires Oliver Truck Plant in Detroit.

The Keeton Motor Company, Detroit, maker of Keeton cars, has purchased the plant formerly occupied by the Oliver Motor Truck Company at Breckenridge and Lawton avenues. The building affords 40,000 square feet of floor space and is well located for manufacturing and shipping purposes, being on the Michigan Central railroad. An accompanying illustration shows the present structure, which will be augmented in the near future by the erection of several additions.

Factory Buildings in Detroit Which Have Just Been Purchased by the Keeton Motor Company of That City.

The officials of the Keeton company are: President, Forrest M. Keeton; vice president and sales director, William G. Houck; directors, C. D. Shaffer, Wilbur Brotherton and Norton Brotherton. F. Ed. Spooner, well known because of his long connection with the automobile industry as a director of publicity, has been appointed advertising manager.

NEW TIRE CONCERN.

Capitalized for $250,000 and Will Erect Factory in Louisville, Ky.

A new concern, to be known as the Speedway Tire Company and composed of business men in Louisville, Ky., Atlanta, Ga., and other cities, is to establish a factory at Louisville for the manufacture of pneumatic and solid tires for motor vehicles of all types. A repair department will be one of the features of the plant. The capitalization of the new company is announced to be $250,000.

Harry L. Lewman, president of the Lewman-Cox Realty Company and chairman of the board of directors of the Falls City Construction Company of Louisville, has been elected president of the new concern, while L. D. Lewman of Atlanta, president of the Manhattan Construction Company of New York City, is first vice president. Other officers are: Second vice president is Fred Haupt of Louisville; treasurer, W. N. Cox, president of the Louisville Public Warehouse Company; secretary, Dr. Fred L. Koontz.

G. W. Greens, one of the most experienced rubber men in the country, who has been in charge of a large plant in the East, has been engaged as manager and has begun his active work, orders having been placed for the necessary machinery to begin operations. As soon as a site can be selected the company intends to build its own plant. About 200 men will be employed at first.

OPENS DETROIT BRANCH.

Manufacturers' Traffic Department to Be Located in Ford Building.

Carrying out the plan recently inaugurated by the National Association of Automobile Manufacturers in an effort to assist the railroads of the country in supplying the industry with available freight cars, J. S. Marvin, general traffic manager, has opened a branch office in Detroit.

The object is to keep the railroads closely advised concerning the movements of freight cars carrying automobile shipments from that centre and to assist them in making prompt return of the cars to the Detroit factories. The plan is expected to obviate many of the difficulties which presented themselves during the past season, as

Digitized by Google

a result of which shipments to various sections of the country were considerably delayed.

Mr. Marvin has selected L. A. Gardner, formerly with the traffic department of the United States Motor Company, as manager of the new Detroit branch. His experience in this field is held to be such that there is every reason to believe that the new plan will meet with decided approval from the first.

SEEKING NEW FUEL.

International Association Will Offer Substantial Prize in Effort to Lower Prices.

The International Association of Recognized Automobile Clubs, at its recent meeting in Paris, France, approved the proposal of Rene de Knyff to raise a prize fund of $100,000 for the best alternative fuel for use in existing internal combustion motors. The regulations have not been drawn up and will not be made public until the government of the interested countries will agree to impose no tax upon the fuel, or at least to admit it at a low fixed rate.

The action was taken because of serious alarm at the increasing cost of gasoline and a stipulation in connection with finding a substitute is that it must be available in large quantities and be of such nature that it cannot be controlled by trusts. The countries represented at the meeting were: France, Great Britain, America, Germany, Austria, Belgium, Denmark, Holland, Hungary, Italy, Russia, Switzerland, Sweden, Egypt, Roumania.

TREASURY AWARDS CONTRACTS.

White and Hupmobile Will Supply Government with Commercial Vehicles.

The general supply committee of the United States Treasury Department, after having the bids under consideration for two months, has awarded contracts for furnishing motor trucks to the government during the balance of the fiscal year, as follows: The White Company, Cleveland, O., maker of White trucks, 1500-pound and 2000-pound trucks, $1950; 3000-pound trucks, $2750; Hupp Motor Car Company, Detroit, maker of Hupmobiles, 1000-pound trucks, $950.

It is expected that 10 or 12 trucks will be purchased under these contracts and at its expiration it is quite probable that new bids will be invited. All these vehicles will be used in Washington, but future bids will probably call for cars to be used in many branches of the governmental service.

LOCATE IN INDIANA.

Milwaukee Men Organize Peru Castings Machine Company to Assist Brown Trucks.

J. H. Barbee, mechanical engineer; E. E. Campbell, practical foundryman, and R. A. Carter, practical machine shop superintendent, all of Milwaukee, Wis., are at the head of the Peru Castings Machine Company, recently organized in Peru, Ind. The new concern will give the Brown Commercial Car Comjany of Peru an additional source of supply in that town and will be of decided assistance in meeting the increasing demand for Brown 1500-pound commercial cars.

When the Brown company was organized it purchased the plant of the Otis Elevator Company for its factory site. Among the numerous other buildings was a large gray iron foundry, 88 by 300 feet, equipped with power cranes and all modern appliances. This is the plant which the new Peru concern will operate. The transfer of property was made for $2500, this including an option on additional land for expansion purposes on the basis of $1000 an acre.

PACKARD'S BUSY DAY.

Returns for Dec. 31, 1912, Show Sales Aggregating $250,000 During 24 Hours.

The largest day's business for the midwinter season in the history of the Packard Motor Car Company, Detroit, was recorded on the last day of 1912, when sales orders aggregating $250,000 were received. For two months total sales were greater in volume than ever before in November and December.

Sales for Packard trucks in December totalled 213 vehicles, amounting in value to $800,000. This is an increase of 24 per cent. over the best previous total for any month's business.

The recently incorporated Dealers' Contest Association, New York City, has chosen the following officers: President, John C. Wetmore; first vice president, W. C. Poertner; second vice president, George Robertson; treasurer, J. C. Nicols; secretary, Edward F. Korbel.

Digitized by Google

TRUING GRINDING WHEELS.

It is important that grinding wheels be kept true if satisfactory work is to be expected. Provision should be made for truing the wheel with a diamond, rigidly supported in a most convenient holder, which is the best methed. This produces a true and smooth surface on the periphery of the wheel and enables it to cut smoothly. It is a fundamental principle in grinding that a smoother surface than that of the wheel cannot be produced on the work, and if the wheel is to cut smoothly its surface must be true.

Dressing is not truing, but sharpening the wheel, and a dresser should never be used on wheels that grind round work. When truing a wheel the diamond should be held in a rigid tool post on the table of the machine. Truing by hand with a piece of emery brick is unsatisfactory for producing good work.

TEMPERING STEEL HARD.

To temper steel very hard, take water, four parts, and salt, two parts, mixed to a paste. Heat the steel until a coating adheres when dipped into the mixture. Next heat to a cherry red and cool in a cold, soft water. The metal will come out white and very hard.

ITALA VARIABLE STROKE MOTOR.

One of the interesting features at the recent Paris Salon was the Itala variable stroke motor, which is novel in that the gearbox is conspicuous by its absence. In the accompanying illustration is presented the principle upon which the engine works and it will be noted that in a general way it is similar to the link motion which is commonly utilized on a railway locomotive.

The design differs from the railway locomotive principle in that the stroke is varied according to requirements, a full stroke being utilized in starting and in climbing grades, but as the resistance is reduced the engine is "linked up" by what is practically a second throttle, and the stroke shortened in proportion to the work required.

The object is to eliminate the change speed gear by varying the stroke. The bore is 130 mm and the stroke can be varied from 90 to 300 mm by shifting the screw block up or down the quadrant. Provision is made for holding the compression constant at all variations of the stroke.

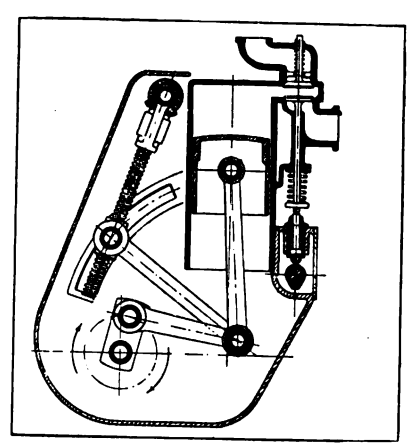


Diagram Illustrating the Principle of the Itala Variable Stroke Motor.

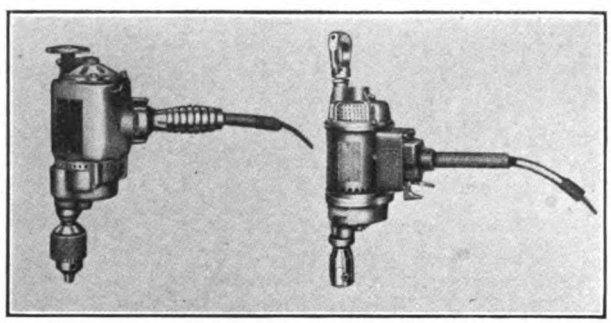
The block is shifted in the link by an oil pressure device in working the engine, instead of a bevel and screw as shown in the drawing, and it is held that no greater effort of the driver is required than for opening and closing the throttle. A clutch and reverse gear are utilized as with other forms of construction.



The Itala firm began its experimentations some four or five years ago and originally the motor was designed for industrial service, but it has been developed to a point where it is held to be practical for pleasure vehicles.

GARAGE AND REPAIR SHOP EQUIPMENT.

MOSSBERG SOCKET WRENCH SET.

Some form of socket wrench outfit is included in the tool equipment of the repair shop and many workmen purchase a set for their kit. While

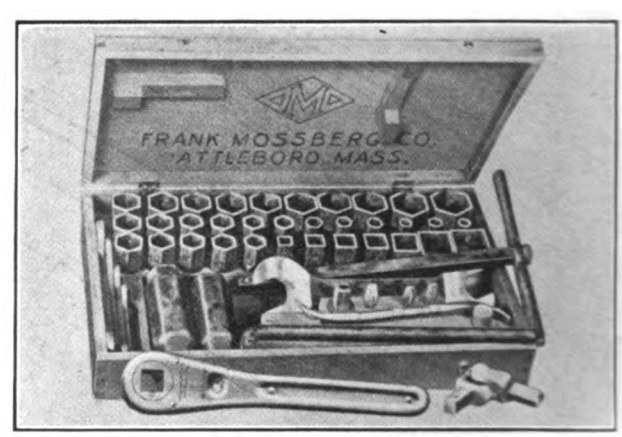
Universal Electric Drills Operating on Direct or Alternating Current.

the socket type is not designed for extra heavy work it is invaluable in removing and replacing nuts and bolts not accessbile with the ordinary tools.

The Frank Mossberg Company, Attleboro, Mass., makes a specialty of wrenches, and in the accompanying illustration is presented the Mossberg socket set No. 14. It will be noted that the outfit is very complete, including as it does handles for every kind of difficult approach, as well as a large number of sockets varying in size from .3125 to 1.28125 inch, inclusive.

The hexagon members are of pressed steel, carefully hardened, and there are 23 of these. There are 11 square sockets, making a total of 34 of these useful members. The wrench is of the ratchet type, sturdily constructed, and is supplied with an extension bar. A Mossberg No. 340 take-down handle, also equipped with an extension bar, is included in the set, as are several wrenches, these comprising an offset, pipe and a general service set of double end members, a universal joint, three spark plug wrenches, three screw driver bits and a cotter pin extractor.

UNIVERSAL ELECTRIC DRILLS.



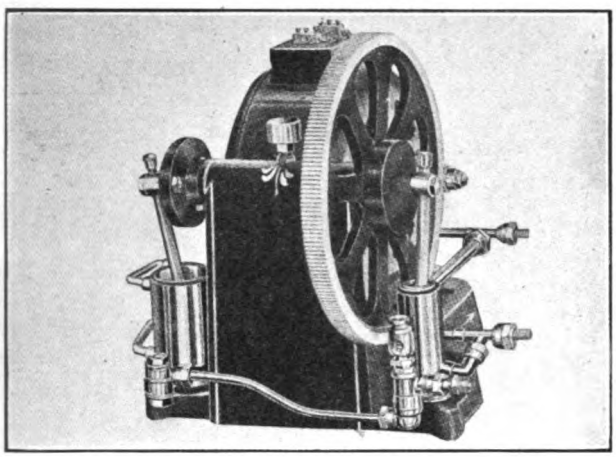
In equipping the repair shop with tools operated by electricity the current, whether direct or alternating, is considered. In the event of a workman being sent to a private garage to overhaul or complete some work on a machine which necessitates the use of a drill, for example, the shop tool may be a direct current instrument and the garage supplied with an alternating current.

The Chicago Pneumatic Tool Company, Chicago, is manufacturing what are termed universal electric drills capable of being operated on direct or alternating current and two types are presented in the accompanying illustration. That shown at the left has a .25-inch capacity for metal work. It is adapted for either 110 or 220 volts, and when operating at its maximum capacity the speed is 600 revolutions a minute. The equipment comprises a breast plate, chuck to take straight shank drills up to .25 inch diameter, and 10 feet of electrical conductor with an Edison connector. The drill weighs about seven pounds, is about 10 inches in height from breast plate to the end of the chuck, and consumes approximately 170 watts at full load.

That shown at the right in the sketch is adapted for drilling holes in metal up to .5 inch and rotates at 450 revolutions a minute when operating at its maximum capacity. The equipment comprises a spade handle, No. 1 chuck, 10 feet of cord and fused connector, and two extra fuses. A breast plate is supplied in place of the spade handle if desired. The weight of the drill is 22 pounds and the shortest length from breast plate to end of chuck is 13 inches. The approximate energy consumption is 400 watts. It is designed for 110 or 220 volts.

AUTOMATIC ELECTRIC AIR PUMP.

A tank of compressed air for inflating tires and for utilization by the customer and workmen, is standard equipment with garages, service



Mossberg Socket Wrench Set Designed for Garage Service and for Handling Difficult Work.

stations and tire repair firms. Many of the last named pipe the tank to the street for the benefit of their patrons and this arrangement makes it

Digitized by Google

necessary that the compressor or pump operate automatically to replenish the supply of air whenever it becomes exhausted.

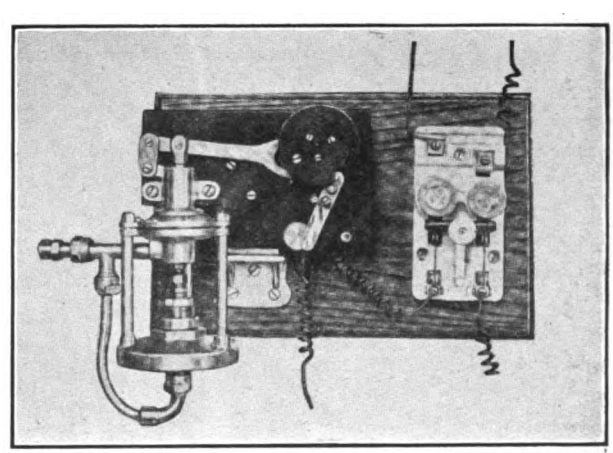
Champion Automatic Compound Electric Air Pump Designed Especially for Garage Service.

The Cleveland Faucet Company, Cleveland, O., is manufacturing an outfit especially designed for this work and in the accompanying illustration is shown the No. 6 Champion automatic compound electric air pump and automatic switch. It is held that the capacity of the pump is sufficient for the largest garage and that with an 18-gallon tank it will furnish enough air to inflate a large tire every minute and at any pressure. A constant pressure of 100 pounds or less is maintained automatically and the pump operates only when the supply of air is reduced.

The compound pumps are back geared direct to the electric motor, and are constructed entirely of bronze, with valves and connections of the same material. The pistons are water jacketed, maintaining a constant circulation of cool fluid, and a water tank is employed, eliminating the necessity of the continuous city supply. The water tank is substantially constructed and is located approximately 1.5 inches above the return connection.

The automatic switch controlling the pump is simple and the maker emphasizes its durability, also the fact that after installation the equipment requires no other attention than an occasional oiling. It is stated that the pump will automatically fill an 18-gallon air tank at the following pressures: Twenty-five pounds in three minutes, 50 pounds in eight minutes, 75 pounds in 12 minutes and 100 pounds in 16.5 minutes.

The specifications are as follows: Dimensions of pump, 15 inches wide, 19 inches deep and 18 inches high; switchboard, nine by 14 inches; diameter of large cylinders, 2.25 inches; small, 1.25 inches; stroke of piston, three inches; motor, alternating current, one-third horsepower; direct, .25 horsepower; revolutions, 150 a minute.



SPEEDWAY ON LONG ISLAND.

Association Incorporated in New York for Holding Automobile and Aeroplane Meetings.

The New York Motor Speedway Association, Inc., of New York City, has been incorporated under the laws of New York State, with a capital of $1,000,000, to hold aeroplane, automobile and motor vehicle races, contests and displays. The directors are: William B. Allen of Seattle, Wash.; Herbert J. Carter of New York City and Alfred B. Casner of Brooklyn, N. Y.

The association has closed a deal for a 650-acre tract of land at Garden City, L. I., which has for some time been used as an aviation field and about March 15 the construction of a two-mile track for automobile races will be begun. The association has a 10 years' lease of the property with the privilege of buying within two years after April 1. The promoters of the association say that for $200,000 they will be able to build the track and put up a grandstand with a capacity of 75,000 persons. There will be parking space for between 15,000 and 20,000 automobiles and it is probable that a long distance race will be held July 4. Another big meet is planned for the autumn, with weekly meets every Saturday during the summer similar to those held on the Brooklands track in England.

The aviation equipment now is under the control of the speedway association and the field

Illustrating Automatic Switch Utilized with Champion Air Pump Outfit.

will continue to be used for aeroplane meets. There are 35 hangars on the field. The site is excellent, being convenient to New York City.

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Starr Garage, Camden, N. J.; $50,000; general automobile business; incorporators, F. L. Starr, H. H. Grace, T. P. Curley.

The Cartercar Sales Company, Youngstown, O.; $10,000; to handle automobiles and trucks in new garage; incorporators, William Beight and others.

Touraine Motors Company, Newark, N. J.; $37,500; general automobile business; incorporators, C. H. Van Vleck, Jr., E. M. Dailey, E. N. Kolb.

Millar Supply Company, Jersey City, N. J.; $100,000; general automobile business; incorporators, J. A. Duffy, W. C. Marley, M. E. Thornton.

Usher Automatic Stop Company, Chicopee, Mass.; $15,000; incorporators, Frank D. Howard, Frank H. Page.

Durable Tread & Automobile Sales Company, Inc., New York City; $10,000; incorporators, Henry A. Deimel, Samuel M. Winkler, Rose H. Jacobs.

Carron & Co., Inc., New York City; $20,000; automobiles; incorporators, Arthur L. Carron, Herman Behr, Karl H. Behr.

S & M Motor Company, Inc., New York City; $10,000; to deal in automobiles, etc.; incorporators, Edward E. Strobel, Walter C. Martin, Richard W. Freedman.

Motor Trading Company, New York City; $10,000; incorporators, William A. Shappard and others.

The Foreign & Domestic Automobile Repair Company, New York City; $10,000; to deal in automobiles, aeroplanes, etc.; incorporators, L. O. Rothschild and others.

F. W. Offeldt & Sons, New York City; $20,000; to deal in motor trucks, etc.; incorporators, Edward Y. Eltonheed and others.

Morristown Auto Company, Morristown, N. J.; $25,000; general automobile business; incorporators, J. J. Lyons, I. Van Gaasbeek, A. Newmark.

Electric Coach Corporation, New York City; $500,000; to manufacture and engage in the motor vehicle business; incorporators, John Larkin, Alexander S. Andrews, Ralph S. Hull, Ralph A. Gamble, Richard J. Lynch, A. J. Doty, A. F. Bennett, E. R. Holmes.

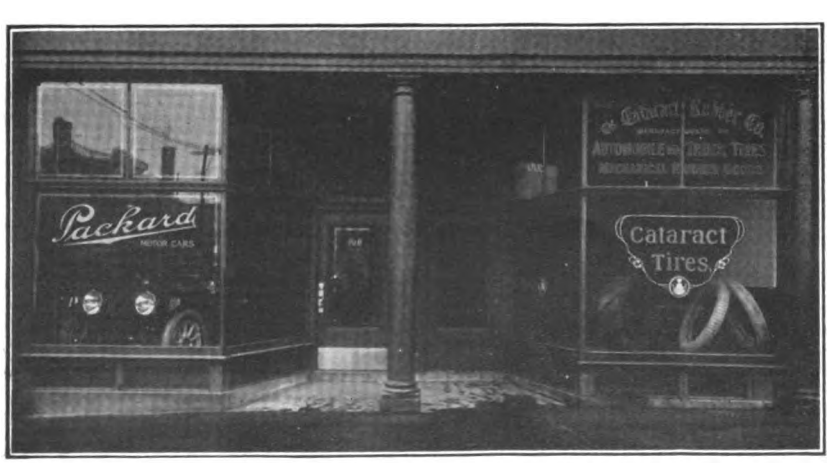
Ball, Washburne Motor Company, Inc., Rochester, N. Y.; $25,000; incorporators, Ward H. Ball, Charles H. Washburne, Asa R. Ball.

Norwalk Motor Car Company of New England, Boston; $75,000; automobiles, etc.; incorporators, C. C. Smith, J. W. Briggs, M. A. Beaudet.

Nolan Bros. Motor Truck Company, Memphis, Tenn.; $10,000; incorporators, J. W. Dickson, W. S. Anderson, E. E. Rucker, E. H. Gerber, L. C. Nolan.

WITH THE MANUFACTURERS.

The Republic Rubber Company, Youngstown, O., maker of Republic tires, has leased the building at 2018-20 Locust street, St. Louis, Mo., to be used as a branch for the company's product. George M. Hoffman, who has been manager of the solid tire department at St. Louis, is manager of the new branch, which will combine the solid tire with the pneumatic tire business.



Harry J. Galvin, for several years chief accountant and later auditor of the Remy Electric Company, Anderson, Ind., has resigned to become president and general manager of the Galvin Specialty Company, a new concern organized at Anderson, which will manufacture and market gas machines for heating, garment pressing and laundry work. In the new company with Mr. Galvin will be associated W. R. Poland, formerly general manager of the Remy Electric Company, and others. Previous to Mr. Galvin's association with the Remy company he was connected with the plate glass industry at Kittanning, Penn.

The Bosch Magneto Company, New York City, announces that the W. G. Nagel Electric Company, Toledo, O., has been appointed a distributor for the Bosch magnetos. The Nagel company carries a complete stock of Bosch magnetos, spare parts, spark plugs, etc., and maintains a specially equipped shop in charge of trained mechanics for the proper installation and adjustment of Bosch ignition apparatus.

E. J. Samuel, who was in charge of the publicity department of the Goodyear Tire & Rubber Company, Akron, O., has been promoted and will be manager of the advertising department of the Goodyear Tire & Rubber Company, Ltd., of Great Britain, with headquarters at Central House, Kingsway, W. C., corner Kemble street, London, England.

The Cataract Rubber Company, with factory in Wooster, O., has opened a factory branch for Cataract automobile and truck tires at 200 Washington street, Providence, R. I. Patrons in Rhode Island will be served by this office. An illustration of the new salesrooms is presented herewith.

The Fisk Rubber Company, Chicopee Falls, Mass., will on Feb. 1 open a completely equipped branch house at 307 Fort street, Winnipeg, Manitoba, Canada. A full line of Fisk tires and tire accessories will be carried.

Rhode Island Branch of Cataract Rubber Company, Wooster, O., at 200 Washington Street, Providence, R. I.

Digitized by Google

The increased demand in Canada for Fisk tires made it advisable to open the branch, which will be one of the most completely equipped of any in the Dominion. R. Phillips will be in charge as manager.

J. V. Mowe, well and favorably known among many in the automobile industry, has become a member of the sales force of the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires.

The Union Top Manufacturing Company, Pittsburg, Penn., has been granted a charter to manufacture and deal in tops, bodies and accessories for automobiles, boats, etc. The incorporators are: John R. Young, James Milholland and Lyman C. Shreve of Pittsburg.

The Thompson-Breese Auto Plow Company, Wapakoneta, O., has been purchased by John Breese, a member of the firm, and the plant is being enlarged. The firm name has been changed to the Breese Motor Plow Company and will manufacture a self-contained tractor and plow carrying three bottoms. The power will be furnished by a gasoline engine and the tractor and plows can be operated by one man.

John N. Willys, president of the Willys-Overland Company, Indianapolis, Ind., maker of Overland cars, has been elected president of the Gramm Motor Truck Company, Lima, O., builder of Gramm trucks. Mr. Willys announces that the plant will be increased and in addition to the one-ton trucks now being produced a new 1500-pound model will be made. H. H. Doehring, for several years general sales manager of the Ohio Electric Car Company, Toledo, O., has been appointed sales manager of the Gramm Motor Truck Company.

Harry C. Tillotson, formerly a director and treasurer of the McDuffy Automobile Company, is now a director and secretary of the Stromberg Motor Devices Company, Chicago, maker of carburetors and motor accessories, and in addition to the active duties of secretary he will have personal supervision of the sales.

W. Haddon Jenkins has resigned as advertising manager of Motor Print to become merchandising expert for the McManus company's advertising agency in Detroit. Mr. Jenkins gained his first experience with the Ireland agency of Philadelphia and was later branch manager for Albert Frank & Co., going from there to the J. Walter Thompson Company, which he left in 1910 to become advertising manager of Motor Print.

Frank E. Smith, for the past three years general manager of the Maxwell-Briscoe Motor Company's plant at Newcastle, Ind., will sever his connection with that plant and with the company as soon as the United States Motor Company, of which the company is a part, is completely reorganized. It is expected that Mr. Smith will announce his plans for the future soon.

The Timken Roller Bearing Company, Detroit, is constructing a new factory for the grinding of the cups, cones and rollers used. The plant will be 64 by 120 feet and will cost $100,000.

Herbert Hughes, for the past six years with the Packard Motor Car Company, Detroit, maker of Packard cars, has joined the sales organization of the Buick Motor Company, Flint, Mich., producer of Buick machines. He sailed from New York Jan. 22 for London to assume charge of European sales. Mr. Hughes was manager of Packard sales in Paris for two years and for four years was with the company at Detroit.

The Remy Electric Company, Anderson, Ind., manufacturer of the famous Remy magneto, announces it has discontinued the Indianapolis branch; owing to the proximity of Anderson to that city it has been found more expedient to care for Remy users directly from the service department of the company located at the home office. E. L. Jones, manager of the Indianapolis branch for the past two years, will continue with the company at the Anderson office.

The Stromberg Motor Devices Company, Chicago, announces that the Indianapolis branch has been transferred to new quarters at 33 West Michigan street.

The Metal Body Tank & Fender Company, 414 Canal avenue, Cleveland, O., has been obliged to enlarge its space and manufacturing facilities and is moving to Payne avenue and East 17th street. The company has recently taken a large contract for automobile bodies that cannot be executed in the present quarters.

The Ford Motor Company, Detroit, Mich., maker of Ford cars, recently purchased a piece of property in St. Paul, Minn., on University avenue, upon which to erect a suitable garage and salesroom to handle the retail trade of St. Paul. The property cost $10,000 and as soon as possible a suitable two-story building will be erected. In Minneapolis, Minn., the company is building an extensive assembly plant and warehouse which, when completed, will be occupied also as a salesroom, garage and warehouse for the handling and distributing of Ford cars throughout the Northwest.

H. M. Denyes of the technical department of the Buick Motor Company, Flint, Mich., maker of Buick cars, has become chief engineer of the Jackson, Church, Wilcox Company of Saginaw, Mich. The concern manufactures the Jacox steering gear and is in the General Motors group. Mr. Denyes has been with the Buick company for the past three years.

The Kissel Motor Car Company, Hartford, Wis., maker of KisselKar and pleasure cars and trucks, has appointed the following agencies: Dominion Motor Machine Company, Medicine Hat, Alberta, Can.; J. L. Maddux, Taft, Cal.; C. C. Eichelberger, Oakland, Cal.; Short's garage, Dwight, Ill.; H. G. Raymond, Fort Wayne, Ind.; Charles H. Lantz, Manhattan, Kan.; Bishop & Chero, Iron River, Mich.; Ball Auto Company, Fargo, N. D.; Alpine Motor Company, Pittsburg, Penn.; J. W. McKee, Sherbrooke, Quebec, Can.; Rydell & Hokenson, White Rock, S. D.; Percival & Silsby, St. Johnsbury, Vt.

Exterior of the Cole Agency in Winnipeg, Manitoba, Held by Breen Motor Company.

Hess & Son, successor to The American Tinol Company, Philadelphia, Penn., has located its offices and salesrooms in the Watkins building, 1031 Chestnut street. A complete stock of Tinol in all forms will be kept on hand.

GARAGE AND DEALER.

Kumpf Bros. has plans for the erection of a large fireproof garage at the Carlton, Tuckerton, N. J., to be fully equipped with a complete line of automobile accessories. A modern repair department also will be installed.

The Breen Motor Company, Broadway and Sherbrooke street, Winnipeg, Manitoba, is agent for Cole cars, made by the Cole Motor Car Company, Indianapolis, Ind., in that section of Canada. The accompanying illustration indicates the size of the present quarters which are held to be decidedly too small, and arrangements are under way for the erection of a substantial addition.

The Peerless Garage, Fairfield avenue and Cannon street, Bridgeport, Conn., conducted by Richard J. Collins, has been fully equipped with a modern machine shop, in which adjusting, repairing and overhauling Ford cars, made by the Ford Motor Company, Detroit, will be made a specialty. The garage is large enough to care for all transient trade, having a storage capacity of 50 cars. Mr. Collins has handled Fords and been connected with

Digitized by Google

Ford agencies since the establishment of the home factory.

W. R. Derrick, owner of the Capitol Stables, Vallejo, Cal., will establish a complete garage in connection with his livery business on Capitol street. He will install modern machinery.

Blonnewitz Brothers of Van Wert, O., has completed the foundations for a two-story fireproof garage and machine shop which will measure 60 by 132 feet. The equipment of the structure will include an electric elevator, private heat and water plants, plate and prism glass, sidewalk lights, etc.

The Standard Garage Company, Uniontown, Penn., is building a $50,000 garage, the foundation work having been begun. The building will be two stories high and of brick and steel construction.

L. C. Rockwell and L. D. Can Hof have opened a first class garage at 406 Scrubner avenue, Grand Rapids, Mich.

Morris H. Wilcher of Rock Island, Ill., has established a modern garage at 1516 Fourth avenue.

Muir Bros. & Fuglesteen, Jackson, Mich., is planning to enlarge its garage and work will be commenced immediately.

The Viaduct Garage, Union, N. J., formerly owned by William Moeller, Park avenue, has been taken over by Louis A. Chatterton and William L. Draffin.

The White Motor Car Company, Nashville, Tenn., has been incorporated with capital of $10,000. The firm will continue to operate its garage at 102-106 Third avenue, N. The president is G. A. Puryear and E. S. Craig is secretary, treasurer and manager.

Apperson-Lee Motor Company of 612 Main street, Lynchburg, Va., will remodel Friends' warehouse as a garage and expects to obtain possession about May 1. The officers of the concern, which has been growing rapidly, are: President and treasurer, R. D. Apperson; vice president, W. B. Miller; secretary, G. O. Lee.

The Cartercar Houston Company, Houston, Tex., has leased the building at 1409 Main street and will be the South Texas distributor of Cartercars, made by the Cartercar Company, Pontiac, Mich. The company was recently incorporated with capital of $20,000. Following are the officers: President and treasurer, R. H. Bushway; vice president, E. Emert; secretary, C. D. Ferguson.

Nolan Bros., Memphis, Tenn., which was recently incorporated by J. W. Dickson, Dr. W. S. Anderson, E. E. Becker and others, will conduct a garage at 291-295 Jefferson avenue, that city.

The Forest Street Garage, of which Joseph Maurie is manager, has been completed and is open for business at Gloversville, N. Y. The company will handle the Metz and Inter-State cars.

Will L. Gould has purchased the interest of his brother in the firm of Gould Bros., Watertown, N. Y., and will continue the business at 223-227 King street, as the Gould Automobile Company.

Dolan & Lewis will occupy the new garage now in course of construction at Springfield, Tenn. The structure is of brick and will be equipped with all modern appliances and supplies.

B. F. Rowe of Orlando, Fla., has purchased an interest in the Sanford Machine & Garage Company of Sanford, Fla., and has moved to that place.

L. K. Fargo and F. B. Vaccaro of Modesto, Cal., have taken possession of the garage on L street in that town and will conduct a general garage and repair shop.

C. M. Marshall & Co., Lexington, Ky., will erect a new garage at 277 North Upper street. It will be modern in every particular.

A. J. Parker & Co., and the Howells Garage & Supply Company of Howells, Mich., have consolidated under the name of Parker-Spencer Company, and the future location will be in the Garage Company building.

The Fonda Auto Company, Fonda, Ia., has leased a building formerly occupied as a moving picture theatre. Possession was taken Jan. 1 and a new garage will be established, to be modern throughout.

Kall & Larson has opened a garage on Main street, Lohrville, Ia., and an up-to-date repair shop has been added.

The Oregon Vulcanizing Company, Portland, Ore., has moved into new quarters on Washington street.

Carson & Granger has erected a new garage at San Jose, Cal., and will handle the Haynes cars, made by the Haynes Automobile Company, Kokomo, Ind.

The Carl Christensen Motor Car Company, San Francisco, Cal., distributor of the Detroiter cars, made by the Briggs-Detroiter Company, Detroit, has moved to new quarters at 567 Golden Gate avenue.

The Worcester Automobile Company, Worcester, Mass., distributor of the Studebaker cars, made by the Studebaker Corporation, Detroit, Mich., has moved into its new garage at the corner of Warren and Cherry streets.

The Miller Automobile Company, Woodstock, Vt., will enlarge its garage to double its present capacity. Increasing business made the change necessary.

The M. S. H. Sales & Rubber Company, Philadelphia, Penn., has opened a branch agency at 660 North Broad street and will carry a full line of standard tires, etc.

The Brooks-Norton Motor Sales Company, Cleveland, O., has moved into new quarters at 2169 East Ninth street. The company handles Ohio electrics, made by the Ohio Electric Car Company, Toledo, O.; Schacht trucks, manufactured by the Schacht Motor Car Company, Cincinnati, O., and Modern trucks, built by the Modern Motor Truck Company, St. Louis, Mo.

The American Motor Car Company, Cleveland, O., has reorganized under the name of the Northern Motor Company, with C. V. Lloyd as manager. The concern is located at 6016 Euclid avenue and is distributor for the American and Marion cars.

The Elyria Auto Sales Company, Elyria, O., is erecting a new automobile building on East Broad street. The building will include a repair department, storage and salesrooms.

C. C. Dorman and J. C. Dorman of Gary, Ind., who have formed a partnership, are establishing an automobile salesroom in the building at 508 Washington street, owned by R. A. Owings.

Charles J. Conohan of the Lake Side Livery, Milwaukee, Wis., has completed a new, modern garage to be operated in connection with his livery business.

The Gray & Mack Sales Company of 1114 South Michigan avenue, Chicago, has become the distributor of the product of the Air-Friction Carburetor Company for the Middle West. The new model "B" is ready for distribution, as well as the new motorcycle carburetor. These models offer new and attractive features.

Harry Salvat of the Fashion Automobile Station at 4610 Cottage Grove avenue, Chicago, will soon erect a large fireproof electric garage at 51st street. It will have a capacity to care for and charge 450 cars.

The Warren Automobile Company, St. Louis, Mo., has outgrown its old quarters and has moved into a new establishment at 3018 Locust street.

The Colt-Stratton Company, New York City, eastern distributor of the Cole, made by the Cole Motor Car Company, Indianapolis, Ind., has moved to larger quarters on Broadway, at 58th street, increasing the space of its service department. The wholesale offices are located on West End avenue at 63d street. W. F. Wilcox has been made advertising manager and F. G. Wilcox of Detroit has been engaged as service expert.

William L. O'Neil, formerly manager of the New York office of the Stromberg Motor Devices Company, Chicago, has been appointed manager of the Detroit office and will have charge of the business in Michigan, Ohio and Canada. His place at New York has been taken by R. B. Whitman, formerly connected with the Bosch Magneto Company.

Samuel Houser and R. N. Hoews of Omaha, Neb., have formed an organization to handle Stevens-Duryea cars, made by the Stevens-Duryea Company, Chicopee Falls, Mass., in Iowa and Nebraska. The new firm is located at 102 Farnham street, Omaha.

The Davis Auto Company, of which Walter Davis is the head, has established larger quarters at 311 Virginia street, Joplin, Mo.

The Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars, has established an up-to-date service station at 325 North Pennsylvania street, Indianapolis, Ind. George O. Wildhack is manager.

The Rising Sun Garage is the new name of the automobile business formerly conducted as a branch of Duyckinck, Sterrett & Co., Rising Sun, Md. The concern has moved into modern quarters on East Main street and H. M. Duyckinck will continue as manager. The plant is equipped with machinery for doing all kinds of repair work.

The Biddeford Motor Mart, Biddeford, Me., distributor of Studebaker cars, made by the Studebaker Corporation, Detroit, is now located in the new Goodwin building under the management of W. F. Goodwin. The rooms are said to be the most attractive east of Boston.

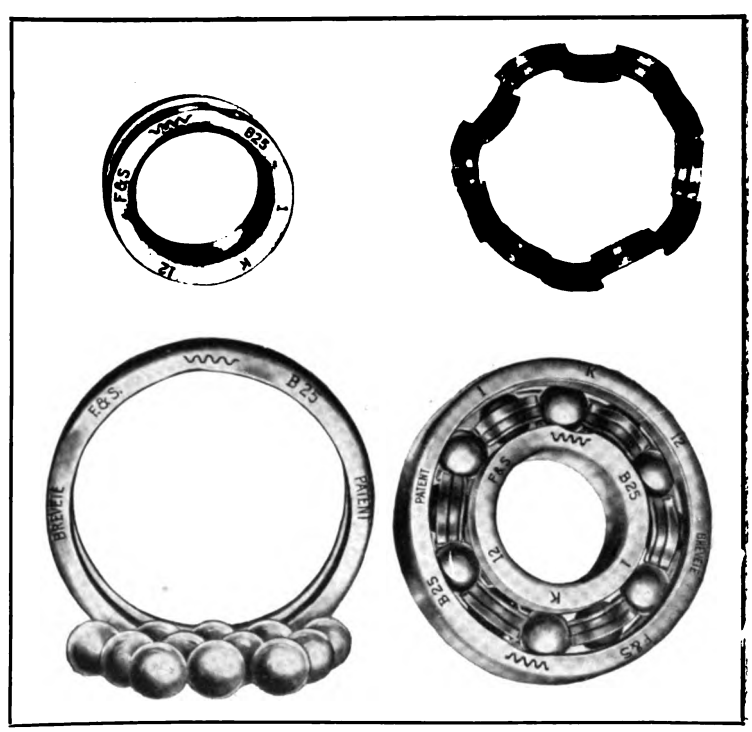
F. & S. BALL BEARINGS.

New Type of Separator Makes Its Appearance on Cars at the Show.

Although not exhibiting the F. & S. ball bearing at the national shows in New York and Chicago, the importer, the J. S. Bretz Company, New York City, was decidedly well represented on the cars displayed in Madison Square Garden and Grand Central Palace. The maker, Fichtel & Sachs, Schweinfurt, Germany, is bringing out a new type of ball separator, which has been added to the well known line of radial and thrust bearings.



The new separator is of one-piece steel construction, and will be known as the ribbon type. It is a unit sheet steel stamping, drawn and formed without joints, welds or rivets. The separator itself is heavily corrugated and ribbed on one side for added stiffness, and finished in gun metal blue. It is held to be light in weight and frictionless.

It is maintained by the maker that its use permits of normally grooved raceways of deeper cross section, its radius lines thus adding to the lateral wall strength of the inner and outer raceways. The radius of the curvature on the inner race is made somewhat smaller than that of the outer race, so that when looking at both raceways sidewise, the outer curves in a manner concave to the ball and the inner convex.

Accompanying illustrations show the construction and the completely assembled bearing. Several advantages are claimed for this new form, among which are that it permits high speed and vibration and that the retainer cannot be affected by heat. In addition the new retainer is held to allow the use of large balls, and in many of the sizes a larger number of balls.

A self-aligning type of radial bearing also has been added to the line. This consists of a standard bearing with a spherical surface on the outer race, and the addition of a washer with a spherical inner surface, held to permit adjustment in case of shaft deflection.

On account of the recent increase in factory space, Fichtel & Sachs is now able to produce special bearings to inch dimensions, or other special constructions without interfering with its standard production. It may be of interest to add that a recent official accountant's tabulation of output developed that over 50 per cent. of the ball bearings produced in the German empire were manufactured by this concern.

Illustrating Constructional Details and Completely Assembled New Type F. & S. Ball Bearing and Separator.

R. Parker Smith of Fort Wayne, Ind., has the following to say of the service he received from a tire made by the Goodyear Tire & Rubber Company, Akron, O.: "Seventeen thousand miles is the distance I have run one Goodyear tire on my car. My odometer has registered that number already and I candidly believe I can get 20,000 miles out of the non-skid tire. The talk about the high cost of tires has had my attention for some time. I believe the cost is due, in most cases, to the lack of attention by drivers. I always keep my tires inflated to the proper pressure and have never been bothered with underinflation troubles. There has never been an occurrence of such a thing as a loose tread or a broken side wall since the air gauge has been used faithfully."

Howard E. Coffin, vice president and chief engineer of the Hudson Motor Car Company, Detroit, maker of Hudson cars, recently participated in a run of the Savannah Automobile Club in the interest of good roads.

PHILADELPHIA'S BIGGEST SHOW.

Pleasure Vehicle Display in One Building Paves Way for Exhibit of Commercial Cars.

The opening of the 12th annual automobile Philadelphia show under the direction of the Automobile Trade Association, in the building of the Automobile Club of Philadelphia on 23rd street, Jan. 18, was informal in character, an evidence of the position the automobile has taken as a serious proposition in the business world. The display occupied three floors and it was the first time the exhibition has been held in one building. The success of the event was due to the untiring work of the show committee, composed of Louis C. Block, president of the association, chairman; Frank Eveland, secretary and treasurer; Archie E. Hughes and William P. Herbert.

Each floor presented a distinct decorative treatment and offered different scenes. The first floor presented an Italian garden in the full splendor of summer with foliage, trees and vistas of lawns, interspersed with a maze of Venetian urns mounted with Mosaic globes and studded with electric lights, of which more than 1000 were used on each floor. Imported leaves in streaming garlands formed the overhead covering. An autumn scene was portrayed on the second floor and the third presented scenes from southern California. At the close of the first week, the commercial vehicle show will be held, Jan. 27-Feb. 1. The list of pleasure car exhibitors follows:

First floor—American Automobile Company, American-Speedwell; Automobile Club of Philadelphia, Marmon; Bergdoll Motor Company, Bergdoll; Detroiter Philadelphia Company, Detroiter; Fiat Automobile Company, Fiat; Jackson-Stutz Sales Company, Jackson, Stutz; Thomas B. Jeffery Company, Rambler; Krit Motor Car Company, K-R-I-T; Longstreth Motor Car Company, Alco; Mitchell Motor Company, Mitchell; North Philadelphia Auto Station, Knox; Oldsmobile Company of Pennsylvania, Oldsmobile; Overland Motor Company, Overland; Regal Sales Organization, Regal; Padula Motor Company, Havers; R-C-H Corporation, R-C-H, Hupp-Yeats electric; Standard Motor Car Company, Velie; J. H. Schumacker & Co., Dorris; Wallace Automobile Company, Pope-Hartford.

Second floor—Automobile Sales Corporation, Cadillac; J. C. Bartlett, Woods and Detroit electrics; Cartercar Motor Company, Cartercar; Gawthrop & Wister, Pathfinder; D. Walter Harper, Case; General Motor Car Company, Lozier, Paige, Rauch & Lang electric; C. A. Haines Company, Baker electric, Herreshoff; E. C. Johnston Company, Premier, Reo; Johnston Motor Car Company, Haynes, Henderson; Locomobile Company of America, Locomobile; Kissel Motor Car Company, KisselKar; Peerless Motor Car Company, Peerless; Stanley Motor Car Company, Stanley steamer; Thornton Fuller Auto Company, S. G. V., Simplex; White Company, White; Motor Car Company, Winton; Imperial Motor Company, Imperial.

Third floor—Buick Motor Company, Buick; Chalmers Motor Car Company, Chalmers; Eldridge Company, Garford; Ford Motor Company, Ford; Foss-Hughes Company, Pierce-Arrow; Gomery-Schwartz Motor Company, Hudson; Oakland Motor Company, Philadelphia branch, Oakland; Michigan Motor Company, Michigan; Packard Motor Company, Packard; F. B. Stearns Company, Stearns-Knight; A. G. Spalding & Bro., Stevens-Duryea; Studebaker Corporation of Philadelphia, Studebaker; Whiting Motor Company, Mercer; Cole Motor Company, Cole; Touraine Company, Touraine; United Motor Company of Philadelphia, Flanders, Maxwell; Sweeten Auto Company, Franklin; Edwards Motor Car Company, Edwards; Cartercar Company, Metz; Liberty Motor Car Company, Apperson, Palmer-Singer; The Seibert Machine Works, Staver.

Accessories, third floor—J. F. Buchanan & Co., Garrison Engine Company, A. R. Justice, Keystone Lubricating Company, Charles F. Kellom & Co., Dahl Punctureless Tire Company, Philadelphia Storage Battery Company, Brown Auto Top Company, Gibney Motor Supply Company, Toby & Co., Rubber Life Company, Walter A. Schott, Motor Parts Company, Myers Bros., J. H. Evanson & Co., Charles S. Smith & Co., Lawrence McFadden Company, J. H. McCullough & Sons, J. H. Glasgow Company, Petroleum Coke Company, J. C. H. Galvanizing Company, C. E. Miller, J. D. Shibe, Lutz-Webster Engine Company, Buffalo Specialty Company, Uncle Sam Motorcycle Company.

TWO BUILDINGS IN MONTREAL.

Seventh Annual Event Was International in Character and Enjoyed Good Business.

Under the glare of countless electric lights and brilliant decorations, the show in the drill hall and sixth armories, Jan. 11-18, proved to be the most spectacular automobile exhibition in the history of Montreal, Can. It was the seventh annual event under the direction of the Automobile Club of Canada and E. E. Wilcox of Toronto was the active manager. The demand for space was so great that the two buildings were secured. this being the first year that such an innovation was necessary.

The best that Canada, the United States, France and Germany can produce were on view, making the exposition international in character. The decorations of both halls were tasteful and simple. The largest Union Jack in the world, which, dotted out with red, white and blue lights, has been one of the features of past shows, this year gave way to 10 unique, cornice like fixtures with a large centre piece studded with lights. some 3000 globes being utilized. The show was opened officially by Mayor Lavallee of Montreal and members of the Automobile Club of Canada. Sales were recorded the first night and throughout the week the various exhibitors secured good patronage. Following are the firms having exhibits:

Auto Tire Company, Ltd., Toronto; Automobile Francaise, Ltd., Montreal; S. F. Bowser & Co., Ft. Wayne, Ind.; Canadian Fairbanks Morse Company, Ltd., Montreal; Canadian Ohio Motor Car Company, Toronto; Canadian Consolidated Rubber Company, Ltd., Montreal; J. I. Case Threshing Machine Company, Toronto; Comet Motor Company, Ltd., Montreal; Consolidated Motors, Ltd., Toronto; Drednot Motor Trucks, Ltd., Montreal; Dunlop Tire & Rubber Goods Company, Ltd., Toronto; Elastic Tire Company, Montreal; Ford Motor Company of Canada, Ltd., Walkerville, Ontario; Goodyear Tire & Rubber Company of Canada, East Toronto; S. Gagnon, Montreal; Gutta

MILWAUKEE'S THIRD SHOW.

Attractive Green and Gold Setting for Cars Valued at $1,500,000.

Over 35,000 people attended the third annual show of the Milwaukee Automobile Dealers' Association in the Auditoruim at Milwaukee, Wis., Jan. 11-18. The estimated value of the exhibits was $1,500,000. Because of the fact that this display was on the national show circuit this year it assumed additional importance, and throughout the week there were numerous conventions of leading Wisconsin automobile organizations.

The decorations were particularly pleasing, the main arena being divided into exhibition spaces by 16-foot columns, which supported urns of palms. An incandescent arch covered with Alabama smilax and Mississippi moss spanned the centre space and on either side were smaller arches similar in design. The lighting effects were such as to bring out the color scheme of green and gold in the best possible manner. The committee in charge was composed of Frank Edwards as chairman, A. J. March and George W. Browne. The list of exhibitors follows:

Pleasure Cars—Wollaeger Auto Sales Company, Studebaker; D. Wittenberg, Cartercar; Packard Motor Car Company, Packard; Cole Motor Car Company, Cole; H. G. Hafemeister, Staver; Oakland-Wisconsin Company, Oakland, Detroiter, Empire; Emil Estberg, Pope-Hartford, Woods electric; Anger Engineering Company, Anger; Wisconsin Auto Sales Company, Herreshoff, Little, Cutting, Chevrolet; American Automobile Company, Pierce-Arrow; Bleinheim Garage, Velie; W. E. Allen Company, McFarlan, Marathon; J. C. Coxe, Stanley steamer; R. C. Rockstead, Warren, Paige; Regal Auto Sales Company, Regal; Archambault Sales Company, Lozier, Michigan; Schreiber-Boorse Company, Locomobile, Hudson; Winton Motor Car Company, Winton; E. B. Leverenz, Elmore, Pullman; Mitchell Automobile Company, Mitchell; Kopmeier Motor Car Company, Flat, Baker electric; E. F. Sanger Company, Stearns-Knight, Marion; Smith-Hoppe Auto Company, R-C-H, Detroit electric, Chalmers; M. C. Moore, White; Boulevard Automobile Company, Nyberg; Curtis Automobile Company, Reo; J. I. Case Automobile Company, Case; Frank Thompson, Apperson; J. H. Menhall, Abbott; First Avenue Garage, Metz, Davis; Jackson Motor Sales Company, Jackson, Hupmobile; E. H. Peshak, Enger; Krit Motor Company, K-R-I-T; E. O. Morse, Crawford; Jonas Automobile Company, Cadillac; Thomas B. Jeffery Company, Rambler; Gas Power Engineering Company, Premier; KisselKar Company, KisselKar; George W. Browne, Overland, Stutz; Buick Motor Company, Buick; Huckman-Lauson-Diener, Ford; Esbensgade & Teague, Waverley electric; Hustis Bros., Stevens-Duryea, King, Borland electric; H. Grede, Pathfinder; Imperial Motor Sales Company, Imperial; Hughes-MacDonald Motor Company, Garford, Ohio electric.

Commercial Vehicles—Kubal & Schauer, Commerce; Curtis Auto Company, Reo; Chase Motor Company, Chase; Schreiber-Boorse Auto Company, Locomobile; International Harvester Company, International; Buick Motor Company, Buick; Crown Commercial Car Company, Crown; G. W. Browne Company, Overland; American Automobile Company, Pierce-Arrow; Stegeman Motor Sales Company, Stegeman; Packard Motor Car Company, Packard; KisselKar Company, KisselKar; Sternberg Manufacturing Company, Sternberg; A. McDougal, Juno.

Sundries—Julius Andrae & Sons, D. Hindman, Aermore Manufacturing Company, Auto Specialty Company, Wallman Manufacturing Company, Auto Supply Company, P. Gross Hardware Company, Feilbach Motorcycle Company, O'Neil Oil & Paint Company, Meile-Blumberg Company, Kemlee Company, General Welding Company, Wadhams Oil Company, Western Fixture Company, Johns-Manville Company, Comet Motor Company, H. D. Plimpton, Milwaukee Rubber Company, Pyreno Company of Illinois, Pommer Boat Building Company.

PLANS FOR BOSTON DISPLAY.

Space for Separate Exhibitions in Mechanic's Building Is Still in Demand.

Although the date of the Boston Automobile Show is still some weeks in advance, so great has been the demand for space that every foot of it has been allotted and the dealers are seeking more. The pleasure car show, which will be held in Mechanic's building, March 8-15, will present the latest type of car, the six-cylinder automobile having a prominent place. The latest refinements in power plants and perfected systems of transmission and lubrication will be found of interest to owners and prospective buyers of these machines. It is anticipated that a larger number of such cars will be shown than ever before, judging from present indications.

The commercial vehicle exhibition, which will be held during the week of March 19-26, should prove a decidedly valuable educational institution and the business men will find much food for thought in an inspection of the varied lines of motor wagons designed and built to meet all sorts of conditions and purposes. The show will have its economic side as well as its service argument, even though the latter appeals most strongly to the broadminded business man. Where economy and service are combined the value of the motor truck over the horse drawn vehicle will be demonstrated at the show.

INDIAN SETTING FOR HARTFORD.

Show Committee Is Preparing Elaborate Scheme for State Armory.

The sixth annual show of the Hartford Automobile Dealers' Association in the state armory, Hartford, Conn., under the able management of F. W. Dart, who has conducted many such events in the past, will this year take on a larger aspect than strictly a local show. Many dealers from all parts of New England have signified their intention of exhibiting and to date nearly all the 50,000 square feet of floor space of the state armory have been contracted for.

The decorations will be exceptionally attractive and will consist of scenes from India, which are now being prepared. The show committee is having painted a large curtain 185 feet wide and 116 feet high, in which will be reproduced the Tahj Mahal and Gardens, which is supposed to be one of the finest buildings in the world of its kind. The other scenes will be presented in panels 25 by 50 feet. The entire building will be covered in, using the colors of India, and the ceiling will be dark blue, thickly studded with stars.

IMPORTERS IN PHILADELPHIA.

New York City Salon Practically Transferred to the First Regiment Armory.

Under the blaze of thousands of incandescent lights and surrounded by an Italian landscape setting of remarkable beauty, Philadelphia was given its first glimpse of a salon of imported automobiles Jan. 18-25. The display was held at the First Regiment Armory and over 30 cars were on exhibit.

Costly models, many of them of special design and ranging in price from $6500 to $18,000, revealed the extent to which foreign manufacturers have carried the art of motor designing. The salon was practically the same as that which was held in New York City and consisted of the following makes: Isotta-Fraschini, Minerva, Metallurgique, De Dion-Bouton, Lancia, Canadian Keeton, Renault, Panhard.

SHOWS IN OTHER CITIES.

Practically every automobile dealer in New Orleans, La., will have exhibits at the third annual show which opens Feb. 19 and already a large amount of space has been alloted. Manager T. C. Campbell is at work perfecting arrangements and is being assisted by this committee: Ginder Abbott, chairman; Joseph Schwartz, J. A. Landry, Lucien Lyons, Jr., and Gus D. Revol.

The fifth annual automobile show at Syracuse, N. Y., will be held in the Armory and Alhambra, Feb. 25-March 1. As in the past the Syracuse Automobile Dealers' Association will be sponsor for the exhibition and 34 pleasure car and motor truck dealers and 12 accessory and motorcycle dealers have applied for space. The decorations this year will be more elaborate than ever before.

The second annual show at Waterbury, Conn., will be held Jan. 27-Feb. 1 and a larger number of exhibits will be seen this year than last. All the space was early contracted for and the latest models will be shown.

After just witnessing the largest automobile show in the history of Montreal, a commercial vehicle exhibition will be held at the Drill hall Jan. 25-Feb. 1. It is planned to have some of the exhibits shown at New York transferred to Montreal for this show.

This year's annual show at Minneapolis, Minn., Feb. 8-13, will be on the national circuit. The exhibit will not only exceed those of previous years in number of cars on display, but also in the matter of decorations.

Plans are rapidly maturing for the show in Rochester, N. Y., which will be held at Exposition park and occupy three buildings, Jan. 27-Feb. 1. Many exhibits have been assured.

Plans for the annual automobile show to be held in Convention hall at Washington, D. C., Feb. 3-8, under the direction of the Washington Automobile Dealers' Association, are being pushed rapidly to conclusion by the show committee. Already a large number of requests for space have been received and 26 different makes of cars have contracted for booths. A feature of the forthcoming exhibition will be the afternoon and evening concerts by the famous Marine band, with Lieut. W. H. Santleman as leader.

The preliminary work for the annual automobile show at Kansas City has been completed and 116 dealers have entered. The exhibit will be in Convention hall two weeks, beginning Feb. 17, but this year there will be two shows in one with double the number of exhibitors. The first week will be devoted to pleasure cars and models representing every large motor car factory in America will be shown. The second week will be given over entirely to commercial vehicles. Another novelty will be the exhibitors' sign composed of three Indian spears.

TRAIL OF THE BULL DOG.

Dr. Percival Introduces His Readers to Little Known Portions of America.

"The Trail of the Bull Dog," is the title of an interesting volume of 100 pages, profusely illustrated, written by Charles G. Percival, M. D., editor of Health magazine, New York City. Dr. Percival recites his experiences during his automobile trip of 50,000 miles during which he covered practically the entire American continent. The book tells of parts of the United States not usually travelled by the tourist and gives a great deal of new information of the country.

The author carries the reader through the Grand Canyon of Arizona, the Zuni settlements of New Mexico, with Madero and his battles and skirmishes in old Mexico and to beyond 64 degrees north in the Klondike over the famous White Pass & Chilcoot trail, and along the banks of the mighty Yukon in the Arctic country. A thrilling account is given of the motorists being lost on the desert and their subsequent rescue by United States troops. Many new and interesting side lights on the early history of America are included in the volume.

NEW BOSTON CORPORATION.

Ultra Motor Car Company, in Process of Organization, Tests Sample Car.

The Ultra Motor Car Company is a Boston corporation, not yet actively engaged in the manufacture of automobiles, but in the process of organization. Only one car has been built as yet, this being a sample machine which has been under test on the road for the past six months.

In a recent issue, the address of the concern was given as Amesbury, Mass., with a suggestion that it was soon to locate in Taunton. R. H. Randall, president and chief engineer, is authority for the statement that this information was incorrect. The other officers of the concern at present are: Vice president and treasurer, E. A. Bagg; clerk, C. A. Parker.

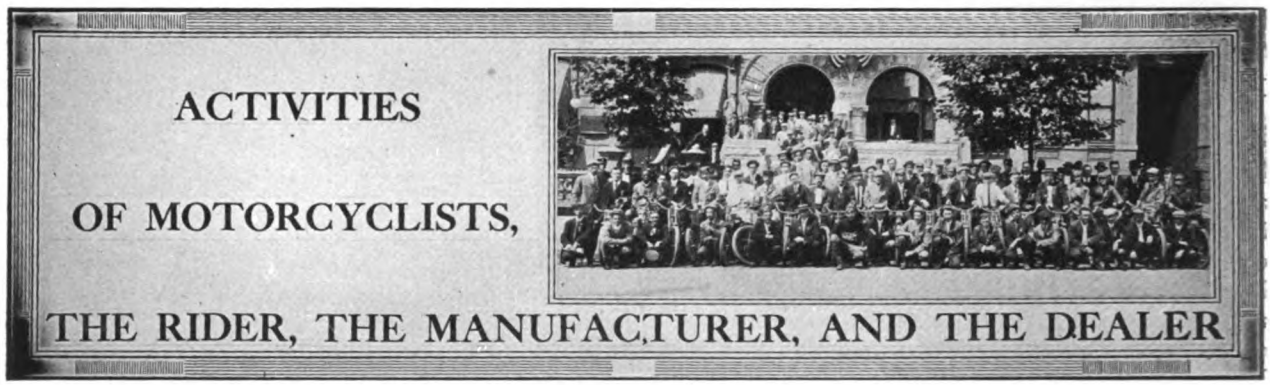
Twenty-nine governors have named delegates to represent their states in the second federal aid good roads convention called by the American Automobile Association to take place at Washington, D. C., March 6-7. Correspondence with the executives in the remaining states indicates that the representation may cover the entire 48 commonwealths.

NEW EMPIRE CATALOGUE.

Personality of Advertising Manager Hyde Reflected in Its Pages.

Harlow Hyde, advertising manager of the Empire Automobile Company, maker of the Empire Little Aristocrat touring car, is a man who delights in details. An example of his personal supervision is found in the new Empire catalogue, just off the press. Its simple dignity and typographical and artistic beauty cannot help but meet with approval.

It is of interest to note that this catalogue was planned and executed in 17.5 days. This means that the text was written, the fine series of car and chassis views were taken, retouched and the cuts made, to say nothing of the simultaneous making of the four-color cover design and its cuts in that time. Mr. Hyde entered the advertising profession a dozen years ago when he became private secretary and press representative of W. W. Denslow, the author of "The Wizard of Oz" and "Father Goose." To his thorough training in the production of books and artistic printing under Mr. Denslow's training, he attributes the clean cut typographical appearance of his publicity work.



Harlow Hyde, Advertising Manager, Empire Automobile Company.

Subsequently he was associated with the advertising departments of the Pacific Coast Borax Company, McClures and Century magazines. He entered the automobile industry in 1909, when he joined the Bosch Magneto Company's staff, where as advertising manager he inaugurated the Bosch News, a house organ, which reflected his ability respecting typographical art.

The commercial and good roads organizations of Colorado Springs, Col., have started a campaign to have the great ocean-to-ocean highway pass through Colorado.

THE NEW YORK SHOW.

In many respects the exhibition of motorcycles in connection with this year's New York show was much more advantageous to the manufacturers and visitors than has been the case in recent years. Aside from the fact that the display was staged on the third floor of the Grand Central Palace, the location was above criticism. The plan of combining this feature with the showing of pleasure cars was one which resulted in a much better attendance, and for the most part manufacturers were kept busy throughout the week signing up agencies.

Fifteen makers displayed machines, and four exhibited sidecars. Some of these latter attracted decided attention. Many of the machines were new and a few makes were being exhibited for the first time in the East. Probably none secured greater interest than the new self-starting Flying Merkels and the big chain driven Emblem twin. The exhibitors, the men in charge and the character of the display with each were as follows:

Motorcycle Exhibitors.

American Motor Company, Brockton, Mass.; W. T. Marsh, Robert Ewell, George P. Jenkins, Henry Heyer, P. McGurkin; one nine horsepower, chain driven Eagle twin; one eight horsepower V belt M-M twin and one 4.5 horsepower, flat belt M-M single.

Aurora Automatic Machinery Company, Chicago, Ill.; E. J. Knight, Edward Rischel, George Rhutasel, H. A. Gliesman, J. C. Foley, B. Ruderman, one four single, one five single, one seven twin; all chain Thors.

Consolidated Manufacturing Company, Toledo, O.; D. J. Wilkes, R. S. Hinds, F. C. Cornish, George Squires, L. Goldsmith, George Reinbold; one five chain single, one five flat belt single, one seven chain twin, one seven V belt twin; all Yales.

Davis Sewing Machine Company, Dayton, O.; H. M. Huffman, F. T. Huffman, J. M. Huffman; two seven twins, two nine twins; all Davis chain driven models.

Emblem Manufacturing Company, Angola, N. Y.; W. G. Schack, W. Hudson, H. Lark, M. E. Gale, one 10 chain twin, two eight chain twins, one four chain single; all Emblems.

Excelsior Motor Manufacturing & Supply Company, Chicago; Ignaz Schwinn, H. N. Kirk, Frank W. Schwinn, S. T. Kellogg, J. W. Grady, M. M. Sladkin; one four belt single, two seven chain twins, two seven belt twins, two seven belt racing twins; all Excelsiors.

Harley-Davidson Motor Company, Milwaukee, Wis.; Arthur Davidson, W. J. Ruble, T. A. Miller, W. J. Walker, J. Buckingham; two eight chain twins, one five belt single, one five chain single; all Harley-Davidsons.

Hendee Manufacturing Company, Springfield, Mass.; George M. Hendee, Oscar Hedstrom, J. F. Weschler, R. W. Ellingham, E. M. Jackson, Howard O'Brien, F. L. Hunt, August Zimmerman, Charles Gustafson; four seven twins, two four singles; all chain Indians.

Henderson Motorcycle Company, Detroit; T. W. Henderson, John E. Rice, R. H. Wheat, Carl F. Gaffner; three four-cylinder, eight horsepower, chain Hendersons.

Ives Motorcycle Corporation, Owego, N. Y.; Lincoln Holland, Jr., W. H. Sayre; one five single, one 10 chain twin; all Monarchs.

Miami Cycle & Manufacturing Company, Middletown, O.; J. W. Ash, F. L. Valiant, J. F. Merkel, W. K. Aurandt, C. A. Van Doren, W. W. W. Sheets, C. R. Mershon, H. C. Mapp, C. G. Lee; one four belt single, one seven belt twin, one seven chain twin, one self-starting seven twin; all Flying Merkels.

Pierce Cycle Company, Buffalo, N. Y.; W. A. Johnson, P. P. Pierce; one seven four-cylinder (shaft driven), one five belt single; all Pierces.

Pope Manufacturing Company, Hartford, Conn.; L. C. Hardin, R. H. Smith, F. Mercer, K. C. Conklin, C. Burbank; two four belt singles, one five chain single, one seven chain twin; all Popes.

Reading Standard Company, Reading, Penn.; A. S. Deysher, Franklin Dolt, G. E. Atkins, W. R. Spear, Eugene Coughlin, Harold King; one four single, one five single, one seven twin; all R-S models.

Schickel Motor Company, Stamford, Conn.; Norbert H. Schickel, C. Wright, Howard Skinner, L. J. Carling; one five chain single, one five belt single, one six single; all Schickels, two-cycle.

Side Car Exhibitors.

Baxter Side Car Company, Cambridge, Mass.; James Baxter, P. Schimmel; one delivery van, one Superb model; all Baxters.

Greyhound Motor Company, Buffalo, N. Y.; W. C. Chadeayne, W. W. Shoemaker, W. E. Eccles; one delivery van, one model S. D., one Auto-Car model; all Universals.

Majestic Manufacturing Company, Worcester, Mass.; C. A. Persons, T. Crabtree, W. F. Hapgood; one De Luxe model, one delivery van, one Standard model, one De Luxe with folding top; all Majestics.

Simplex Machine Works, Brooklyn, N. Y.; one model A Simplex.

At the Sidecar Booths.

Sidecars were very much in evidence this year. Several motorcycle makers displayed them in connection with their regular mounts, the Hendee Manufacturing Company being one of those which brings out a sidecar designed especially for use with Indian machines. There were four manufacturers who exhibited direct, as listed above.

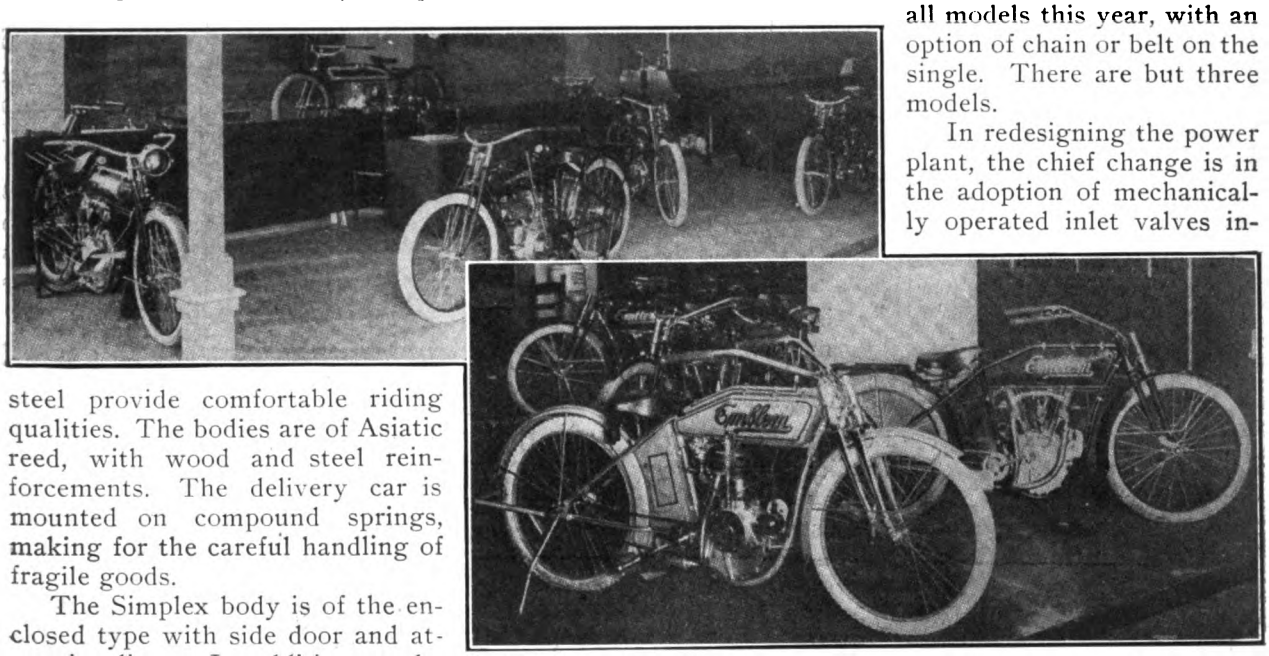
The Baxter is made under the same patents as those in England, and since this form of passenger carrier has enjoyed wide popularity in Great Britain for a number of years this product

Digitized by Google

should prove of interest in America. A particular feature claimed for the construction is the use of a shock absorbing side axle, comprising a rocker arm pivotally secured to the main axle tube of the axle shaft extending from the rearward end of the arm. The forward extension of this arm is considerably longer than the rear portion, the upper end being carried on a vertical post secured to the frame side. This is held to provide a marked spring action between the wheel and frame proper, in addition to the spring action allowed between the frame and the body of the vehicle.

The maker of the Majestic claims to be the only concern in America using drop forgings exclusively for sidecar attachments. Large four-leaf C springs of carefully tempered vanadium steel provide comfortable riding qualities. The bodies are of Asiatic reed, with wood and steel reinforcements. The delivery car is mounted on compound springs, making for the careful handling of fragile goods.

The Simplex body is of the enclosed type with side door and attractive lines. In addition to the usual clamps at the forward tube and right fork side, a vertical tube passes midway between the sidecar and the motorcycle, this tube being secured to the axle shaft and extending about five inches below that point. From the lower end of this tube a vertical brace extends to and is clamped to the axle shaft near the right spring hanger. A diagonal brace is provided with a clamp by which it may be bolted to the vertical tube at any desired angle and height.



The centre of interest at the Greyhound Motor Company's booth was the Universal Auto-Car model. This company has been engaged in the manufacture of the Greyhound motorcycle, but the production in this field has been limited in favor of the sidecar, and there is an announced desire to lead rather than follow in the newer branch. The Auto-Car body is of aluminum, and the car is in every respect a miniature automobile, the design being with the idea of providing the utmost comfort. Springs are of the automobile type, comprising two three-quarter elliptic members. The attachment fittings are all of steel, carefully machined and are held to be exclusive with the Universal.

The New Emblems.

Naturally, the most interest in the Emblem exhibit was directed toward the new 10 horsepower twin, the highest powered machine in the show. It does not differ materially from the other members of the Emblem line, except in the matter of size. The chain drive is fitted to all models this year, with an option of chain or belt on the single. There are but three models.

In redesigning the power plant, the chief change is in the adoption of mechanically operated inlet valves instead of the automatic members used heretofore. Due attention has been paid to the matter of accessibility. The cylinder cooling flanges taper toward the base, making for easy removal of the cylinders. A new type of screw clamp replaces the coupler formerly used for attaching the exhaust manifold, and the inlet manifold has been provided with a split joint in the centre, simplifying removal and replacement.

The frame has been changed so that the upper tube is two inches higher at the front than formerly, making provision for a larger size tank, which now has capacity of 2.5 gallons of fuel and two quarts of oil. The forks are wider, permitting the use of tire chains if desired. The lug-

struction which may be regarded as new, these are largely in the nature of refinements.

The Self-Starting Merkel.

The changes in the Flying Merkel line are numerous, as is well known by readers of The Automobile Journal, a complete description of the 1913 models having been presented recently. In view of the fact that this line contains the first self-starting motorcycle made in this country, perhaps that was the feature which attracted most attention during the show. This is fitted to the two-speed models, which also are provided with foot boards, long stroke motor, cushion frame luggage carrier, mechanical oiler, etc.

The self-starting, seven horsepower twin was the centre of the exhibit, and on this was mounted a Chinaman, dressed in a yellow jacket, calling particular attention to the new name, selected as a result of the prize contest recently announced. In this contest 17,092 names were presented. The committee came to the conclusion that the term "Yellow Jacket" best fitted the new production and the prize of $100 was divided among the 26 successful contestants. Checks for $3.84 each have been mailed to the names listed below, and the 26th winner will receive a similar check so soon as the address is learned.

F. A. M. Directors' Meeting.

The board of directors of the Federation of American Motorcyclists held a meeting in New York during show week. Secretary-Treasurer G. B. Gibson of Westboro, Mass., read a financial statement covering the first six months of the fiscal year, showing a balance of $5248.04 on hand Jan. 1. E. M. Estabrook, Bangor, Me., chairman of the membership committee, made a general statement regarding his work and plans for the coming year.

J. Leo Sauer of New York City, chairman of the legal action committee, read W. H. Wells' report regarding his representation of the federation at the formation of the International Motorcycle Association, at its meetings in London and Paris. It was voted that Mr. Wells' action in this matter be referred to the legal action committee, which, if it sees fit, was instructed to ratify such agreement.

Secretary Gibson was instructed to write the secretary of the Canadian Motorcyclists' Association that the federation would be glad to issue to trade C. M. A. members F. A. M. registered repair shop certificates and signs, provided such members have received a similar certificate from the C. M. A. A letter was read from the president of the Canadian association, stating that the C. M. A. had adopted the F. A. M. competition rules, practically in their entirety.

Auto-Car Model Universal Sidecar Made by the Greyhound Motor Company, Buffalo, N. Y.

SPEED

Here It Is! THE FLYING MERKEL

The Prize Winning "Yellow Jacket" Model

The Only Self-Starting Two-Speed Motorcycle in the World

In the trade papers of December we offered $100.00 in gold to the person suggesting the most suitable name for Model 45 and 75. The contest closed on December 15th. As evidence of the wonderful sensation these new models created, no less than 17,092 names were submitted before December 15th. Several thousand names came in after the contest closed but these of course could not be counted. After two weeks of careful study the judges decided upon the word "Yellow Jacket." As more than one person submitted the name "Yellow Jacket" we were compelled to divide the $100.00 proportionately. Accordingly the following persons will receive a check for $3.84 this week:

Chas. Anderson, No. 1063 Perry Ave., Chicago, Ill.
James J. Shea, Sidney, O.
Chas. Reith, High Point, N. C.
Wm. J. Martin, Box 123, Brocton, N. Y.
A. F. Lattig, Payette, Idaho.
Maurice Fitzgerald, No. 86 Commercial St., Bridgeport, Conn.
R. S. Hickey, No. 198 Summer St., Paterson, N. J.
Russell A. Evans, care Cadillac Motor Car Co., Detroit, Mich.
E. A. Emmert, Publisher Dallas Center Times, Dallas Center, Iowa.
N. C. Hildebrand, Butler Co., Eidenau, Penn.
J. C. Youngblood, Agt. Overland Car and Excelsior Motorcycle, Atwood, Kansas.
Roy H. Arthur, care Elk Motor Truck Co., Charleston, W. Va.
Geo. F. Devers, No. 1420 Blondeau St., Keokuk, Iowa.
Ernest Mobberly, No. 1312 Scott Ave., Canton, Ohio.
F. C. Dolder, St. Charles, Minn.
Harry C. Wise, Crete, Ind.
C. M. Shaw, Concordia, Kansas.
Rafe M. Lindsey, No. 148 E. 6th St., Anderson, Ind.
Lee Wolary, R. R. No. 1, Wilmington, Ohio.
Russell Hicks, R. F. D. No. 8, Santa Barbara, Cal.
Chas. W. Johnston, Delaware, Ont.
Francis Miller, No. 719 E. 4th St., Canton, Ohio.
W. B. Glasser, No. 780 Downey St., Denver, Col.
Arthur B. Cockrum, Ontario, Ore.
Evart J. Deakins, Box 164, Roff, Okla.

One card containing the prize winning name was received without the name and address of the sender. The check will be forwarded upon proper proof being sent.

tions amounting to $6744.50, out of which there was paid $2912.50 to referees. It was voted, on motion of Dr. Thornley, that all money coming into the hands of the competition committee be forwarded immediately to the secretary-treasurer, with the former's voucher for the same, and that the chairman of the committee shall make drafts on the treasurer for all expenditures as provided for by the board of directors.

Among the other matters decided were the following: The treasurer was instructed to mark all checks deposited by him "No Protest;" the chairman of the competition committee was instructed to communicate with the chairman of the competition committee of the Auto Cycle Union of Great Britain regarding the classification and publishing of world's records; one hundred dollars was taken from the professional riders' relief fund to be given to Jacob DeRosier,

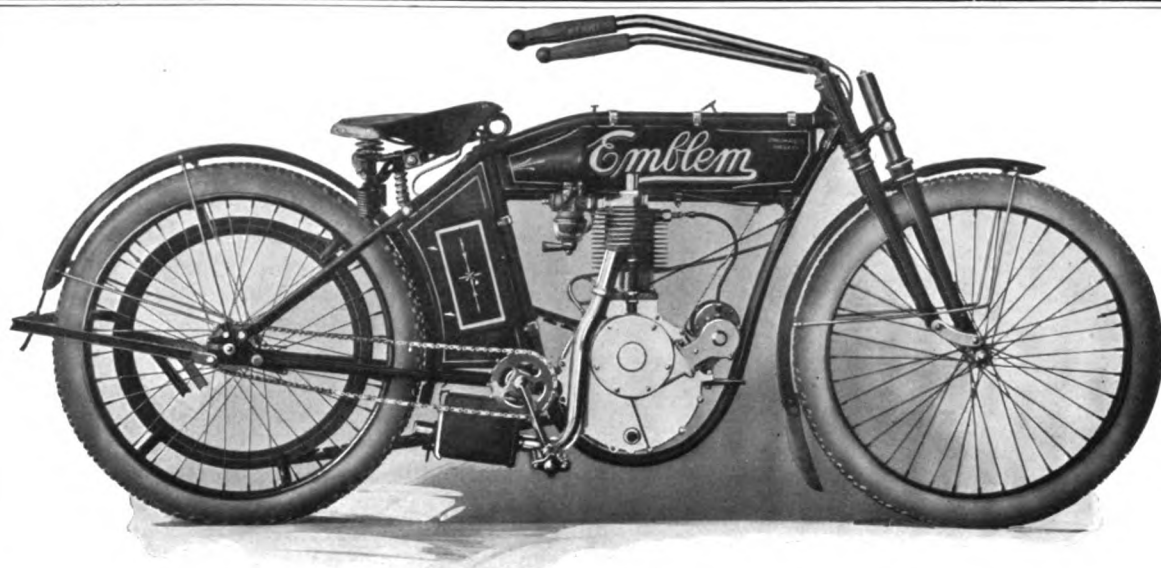
Harry Smith of Allegan, Mich., and His Emblem Mount.

who was injured in competition on the Pacific Coast last year.

Invitations for the 1913 assembly were received from Denver, Col., and Brooklyn, N. Y., but as this matter does not come before the board until later the secretary was instructed to so notify the parties interested.

Chicago's Separate Show.

For the first time in the history of the motorcycle industry a separate national show will be held under the auspices of the Motorcycle Manufacturers' Association in the Manufacturers' Exhibition building, Chicago, Feb. 3-8. That the industry welcomes the opportunity to exhibit at a display of this character is evidenced by the number of makers who have secured space. The committee in charge of the arrangements includes A. B. Coffman, Frank J. Weschler and Arthur Davidson. The list of exhibitors follows:



Space. Exhibitor and Address.

1—Pope Mfg. Co., Hartford, Conn.
2—Ives Motorcycle Corp., Owego, N. Y.
3—Chicago Cycle Supply Co., Chicago, Ill.
4—Bosch Magneto Co., New York, N. Y.
5—H. & F. Mesinger Mfg. Co., New York, N. Y.
6—Excelsior General Supplies Co., Chicago, Ill.
7—Mead Cycle Co., Chicago, Ill.
8—Purdy Bros., Chicago, Ill.
9—Van Cleef Bros., Chicago, Ill.
10—Angsten Koch Co., Chicago, Ill.
11—Eclipse Machine Co., Elmira, N. Y.
14—Fox Mfg. Co., Seattle, Wash.
15—North Chicago Machine Co., Chicago, Ill.
16—Greyhound Motor Co., Buffalo, N. Y.
17—Beckley Ralston Co., Chicago, Ill.
18—Allied Motors Corp., Chicago, Ill.
19—Excelsior Motor, Mfg. & Supply Co., Chicago, Ill.
20—R. S. Crawford, Saginaw, Mich.
21—Aurora Automatic Machinery Co., Chicago, Ill.
22—Sarco Engineering Co., New York, N. Y.
24—Fowler Carnes Co., Aurora, Ill.
25—Wheeler & Schebler, Indianapolis, Ind.
26—Weed Chain Tire Grip Co., New York, N. Y.
27—Atlas Specialty Mfg. Co., Chicago, Ill.
28—National Cycle Accessories Co., Aurora, Ill.
29—Graton & Knight Mfg. Co., Worcester, Mass.
30—Majestic Mfg. Co., Worcester, Mass.
31—Reading Standard Co., Reading, Penn.
32—Harley-Davidson Motor Co., Milwaukee, Wis.
33—Hendee Mfg. Co., Springfield, Mass.
34—Miami Cycle & Mfg. Co., Middletown, O.
35—Kokomo Rubber Co., Kokomo, Ind.
36—Aermore Mfg. Co., Chicago, Ill.
37—Victor Auto Parts Co., Cincinnati, O.
38—Standard Welding Co., Cleveland, O.
39—Corbin Screw Corporation, New Britain, Conn.
40—Hawthorne Mfg. Co., Bridgeport, Conn.
41—Standard Thermometer Co., Boston, Mass.
42—H. T. Roberts, Chicago, Ill.
43—Schickel Motor Co., Stamford, Conn.
44—Minneapolis Motor Co., Minneapolis, Minn.
45—Pierce Cycle Co., Buffalo, N. Y.
46—American Motor Co., Brockton, Mass.
47—Henderson Motorcycle Co., Detroit, Mich.
48—Emblem Mfg. Co., Angola, N. Y.
49—Consolidated Mfg. Co., Toledo, O.
50—Waverley Mfg. Co., Jefferson, Wis.
52—Excelsior Cycle Co., Chicago, Ill.
53—Barco Brass & Joint Co., Chicago, Ill.
54—Herz & Co., New York, N. Y.
55—Badger Brass Mfg. Co., Kenosha, Wis.
56—Great Western Mfg. Co., Laporte, Ind.
57—Iver Johnson's Arms & Cycle Co., Fitchburg, Mass.
58—Baxter Side Car Co., Cambridge, Mass.
59—Chicago Belting Co., Chicago, Ill.
60—New Departure Mfg. Co., Bristol, Conn.
61—Splitdorf Electrical Co., Newark, N. J.
62—Black Hawk Motor Co., Rock Island, Ill.
63—F. W. Spacke Machine Co., Indianapolis, Ind.
64—Fentress-Newton Mfg. Co., Detroit, Mich.
65—J. W. Bottomley, Chicago, Ill.
66—Hughes & Wessling, Chicago, Ill.
67—Queen City Iron & Wire Works, Denver, Col.
68—Morrison-Ricker Co., Grinnell, Ia.
69—Feilbach Motor Co., Milwaukee, Wis.
70—Jenkins & Co., Des Moines, Ia.
71—Hine-Watt Mfg. Co., Chicago, Ill.

Bosch at the Show.

Although the Bosch Magneto Company, New York City, did not make display at the New York automobile show, it was well represented at the motorcycle section, 77 per cent. of the machines on exhibit being equipped with Bosch magnetos, according to a count made by the company. This is a gain of 8 per cent. over the showing made last year. It may be added in this connection that all the motorcycles displayed were fitted with magneto ignition, as compared with the situation three or four years ago, when at

EMBLEMISM AND OPTIMISM GO HAND IN HAND

Do you, Mr. Rider, feel the bumps along your way? Emblemize.
Does your engine trouble? Do you something awful say? Emblemize.
Do you, Mr. Dealer, like to see your business pay? Emblemize.
To please the rider helps the dealer. It's the Emblem way. If you're wise, Emblemize.

Write Dept. D for Catalogue and Descriptive Literature. Dealers, Ask for Agency Proposition.

THE EMBLEM MANUFACTURING COMPANY

Also Makers of the Famous Emblem Bicycles.

ANGOLA ERIE COUNTY NEW YORK

least 50 per cent. of the machines were equipped with battery ignition.

New Members Admitted.

The Motorcycle Manufacturers' Association, at its recent meeting at New York City, took steps to assist dealers, without expense to the latter, to obtain refunds on excess freight charges in the western territory on shipments of less than carload lots, under the recent decision of the Interstate Commerce Commission. The Excelsior Cycle Company and the Allied Motors Company of Chicago, were admitted to membership in the organization. The tariff committee filed a brief with the United States Senate protesting against lowering the tariff on motorcycles. The next meeting of the association will be held during the Chicago motorcycle show.

Another World Tour.

A motorcycle tour of the world is being planned by Milton S. Hopkins, secretary of Carnegie college, Rogers, O. Mr. Hopkins plans to visit every country on the six continents for the purpose of observing the customs and economical conditions of each country. He will be accompanied by two others. Motorcycles were chosen as a mode of transportation because of their reliability and economy, but primarily because of their ability to take their riders into the byways of the world, where it is often impossible to penetrate conveniently by any other method.

F. A. M. Veteran Pins.

The Federation of American Motorcyclists has received a supply of special veterans' pins, similar to the distinctive founder pins. These are of rolled gold and have the word "Veteran" on a scroll between the tips of the wings of the F. A. M. emblem. The pins are for those joining the F. A. M. during the five years after the first

JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

year of the organization's existence, and those members holding cards numbered from 238 to 2762 inclusive are eligible to order and receive

M. E. Gale and His Emblem in New York City at the Completion of His Ride from Angola, N. Y.

them. A special design of F. A. M. pennants to hang perpendicularly as a wall ornament also has been ordered. These are distinctive from the other pennants and are suitable for club or home.

Gale's Cross Country Ride.

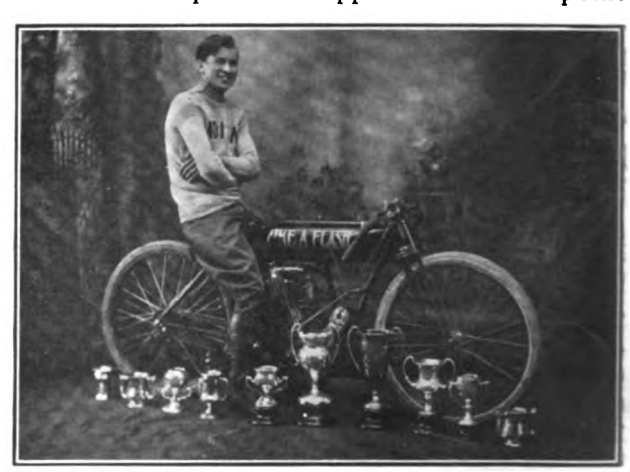
One of the interesting features in connection with the New York Show was the long distance cross country ride of M. E. Gale on an Emblem, from the factory of the Emblem Manufacturing Company, Angola, N. Y., to the Grand Central Palace in three days and seven hours. Heretofore this has been considered a task sufficient to try the ability of the machine and rider even in the best of weather. It goes without saying that it was a striking illustration of the sturdy qualities of the new Emblem.

Gale left Angola at 11 Sunday morning and arrived in New York Wednesday evening at 6. The photograph reproduced herewith was taken soon after his arrival, and indicates the manner in which he was prepared for the trip. That these precautions were necessary is admitted, when it is learned that the weather was bad all the time, and the road conditions were far from ideal.

From Angora to Leroy a hard rain was falling and freezing as it fell. A little later snowdrifts reaching to the fork of the machine were encountered for several miles, and between Geneva and Waterloo it became necessary to ride on the railroad ties. The remainder of the distance into New York City was over roads comparatively better, but not like summer riding.

Mississippi State Commissioner.

B. C. Moss of 3303 8th street, Meridian, Miss., has been appointed state commissioner by President Patterson of the F. A. M. H. S. McCrillis of 219 Newbury street, Lawrence, Mass., has been appointed local commissioner by the state commissioner of his district.



New Track on the Coast.

Dr. J. P. Thornley, chairman of the competition committee of the F. A. M., has been notified that the Portland Motorcycle Club, Portland, Ore., has arranged for the formation of a $10,000 company to build a board saucer track to be operated next summer. It is planned to hold motorcycle race meets during the coming season.

One-Legged Rider Completes Tour.

Despite the fact that he is physically handicapped by having only one leg, Joseph R. Schantin of Portland, Ore., recently completed a most remarkable motorcycle tour. He had several months' vacation and although the trip was deemed impossible by his friends, he determined to tour the country and incidentally visit some friends and relatives in the East. With a companion, A. J. Nesig, he left Portland the latter part of May, 1912. Both men rode Flying Merkels, made by the Miami Cycle & Manufacturing Company, Middletown, O. San Francisco was reached after a stop at Stockton, Oakland and other points of interest. From San Francisco the ride was through Santa Barbara, Los Angeles, to San Diego, thence across the upper portion of the Mexican frontier to Yuma, and Phoenix, Ariz., and El Paso, Tex.

Schantin's partner dropped out at this point

Earl Gove, Brockton, Mass., and the Prizes He Won During 1912 with His Indian.

and shipped his machine back to Portland and Schantin continued alone. Leaving El Paso he proceeded across Texas, Oklahoma, Kansas.

Digitized by Google

Missouri, to St. Louis, Cincinnati and Columbus, O., the latter place then being the scene of the annual convention of the F. A. M., which Schantin attended. He next returned to Cincinnati and rode across Ohio and West Virginia to Wheeling and Washington, D. C., where he was greeted by President Taft. The plucky rider then went to Baltimore, Philadelphia, New York, Boston and Portland, Me. The return trip was through Boston, Albany, Syracuse, Buffalo, Cleveland, Chicago, Milwaukee, St. Paul, Minneapolis and across the Canadian border into Canada. Schantin covered in all more than 10,000 miles and his Merkel mount was in excellent condition. He states that he will ride the same machine on a trip around the world if he can succeed in inducing a companion to go with him.

New Registered Repair Shops.

Following is a list of repair shops recently registered with the F. A. M.: Edward G. Haggett, Portland, Me.; City Garage, Haviland, Kan.; W. Ambler Stetser, Paulsboro, N. J.; Knight Mercantile Company, St. Louis, Mo.; Amos S. Meginness, San Juan Bautista, Cal.; Woolley & Henderson, Lead, S. D.; F. A. Shottenheimer, McDonald, Penn.; Dolezal Bros., Chicago; Fred S. Jones, Beverly, Mass.

Merkel in Municipal Service.

The motorcycle has within the past year or so demonstrated its efficiency in municipal service and is rapidly increasing in favor in certain lines of work, having proved that it is no longer an experiment, but an indispensable factor for the public welfare. At Dayton, O., for instance, every precinct has two or more Flying Merkels, made by the Miami Cycle & Manufacturing Company, Middletown, O., which are kept in constant readiness for emergency calls. The riders are experienced in their work and are called the "Minute Men of the Force." They are kept on duty day and night and owing to their promptness in getting to the scene of trouble several lives have been saved. As evidence of the genuine value of these machines to the Dayton police department, it is cited that 75 per cent. of the cases before the grand jury at the last term were presented by the motorcycle officers.

Park supervisors, highway inspectors, tenement inspectors and many other municipal workers have found in the motorcycle a rapid and convenient means of transit. Elmer H. Gress, supervisor of the public playgrounds of Dayton, finds his Merkel machine of incalculable value to him. He can appear at one playground and inaugurate the numerous games and within five minutes can be at another field in a distant part of the city, officiating in the same capacity. It is predicted that a large number of motorcycles

Officer W. C. Holcomb of Hartford, Conn., and His Flying Merkel.

will be added to the municipal departments of many cities in the country.

To Distribute Pope Mounts.

The Pope Manufacturing Company, Hartford, Conn., has appointed the following distributors for Pope machines: George S. Uniss, Brooklyn, N. Y.; G. H. Poppenburg, Buffalo, N. Y.; E. W. Fisher, Rochester, N. Y.; Edward Berghoff, Asbury Park, N. J.; Ward Bros., Camden, N. J.; William E. Wandersee, Detroit; A. W. Erpenstein, Saginaw, Mich.; Vincent Bros., Cleveland, O.; Flory Bros., Lancaster, Penn.; Auto Motor-

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

B. A. SWENSON 522 Broad St., Cor. Blackstone St., Providence, R.I.

1913 F. N. SHAFT-DRIVE MOTORCYCLES.

Lightweight Single, with Two-Speed Gear	$275
Only Machine Built With Handle Bar Control of Clutch.

cycle Company, Philadelphia, Penn.; W. W. Bennett, Pittsburg, Penn.; Pope Motor & Cycle Company, Oklahoma City, Okla.; J. H. Tubman, Lincoln, Neb.; O. C. Allenbach, Eldorado, Kan.; New England Motorcycle Company, Boston; Eastern Cycle Company, Hartford, Conn.; C. W. Ellison and Auto Tire & Repair Company, Bridgeport, Conn.; H. W. Vandever Company, Wilmington, Del.; H. W. Higham, Jr., Washington, D. C.; Harper & Powers, Jacksonville, Fla.; Dilts & Jeffries, Miami, Fla.; Island City Electric Work & Supply Company, Key West, Fla.; W. H. C. Dudley, Americus, Ga.; L. S. Crane, Atlanta, Ga.; W. H. Holmes, Augusta, Ga.; Ellis Bicycle Company, Wichita, Kan.

Chicago Dealers Reorganize.

The Chicago Motorcycle Dealers' Association, which was allowed to go out of existence some time ago, has been resurrected and reorganization was effected recently with these temporary officers: President, R. R. Hill; secretary, R. T. Purdy; treasurer, R. P. Miller. Eleven Chicago firms were represented at the meeting.

Rival Coast Association.

The Western Federation of Motorcyclists is the name of a rival organization to the F. A. M., which is designed to cover all territory west of the Rocky mountains. Provisional officers were elected until March 1, when organization plans are to be completed, it is stated. H. G. Hedges of the San Francisco Motorcycle Club was elected provisional president, while Volney E. Davis was appointed secretary. Districts were formed as follows: Seattle, Portland, San Francisco and Los Angeles.

Indiana State Convention.

The first state motorcycle convention will be held by Indiana motorcyclists at Indianapolis, May 16-18. The first day will be devoted to business and the last two days will include a 24-hour motorcycle endurance run. The details of the convention are being arranged by O. F. McLain, state commissioner, and the state executive board, E. P. Whitmer, John Merz, E. G. Baker, Roy Sonneborn and Elmer Smith.

New Merkel Agencies.

Among the important agencies closed for Flying Merkel motorcycles recently are the following:

C. W. Nicodemus, Newton, Kan.; A. P. Naylor, Salina, Kan.; W. V. Hollingsworth Company, Zanesville, O.; James Mayo, Reading, Penn.; Motorcycle Sales Company, Scranton, Penn.; H. L. Gregory, Wilkesbarre, Penn.; G. E. Waters Hardware Company, Junction City, Kan.; Georgia Auto Exchange, Montgomery, Ala.; W. A. Duff, Pontiac, Ill.; Charles B. Hill, Warren, Penn.; Henry W. Peabody, Argentine Republic, South America.

Will Produce Accessories.

William E. Eccles has severed his connection with the Persons Manufacturing Company, Worcester, Mass., with which concern he was general sales manager, and has organized the Universal Manufacturing Company in the same city to produce metal specialties and a line of motorcycle accessories.

Club Notes, Here and There.

The Detroit Motorcycle Club, Detroit, will hold an entertainment once a month and a club house will be opened in the spring. The following new officers have been elected: President, J. B. Gault; vice president, W. H. Field; secretary, Charles Drude; treasurer, A. P. Hubbard; sergeant-at-arms, J. E. Mindedel; directors, J. B. Trossel and Henry Smith.

The following officers have been elected by the Utica Motorcycle Club, Utica, N. Y.: President, Erastus R. Stevens; vice president, Charles A. Alt; secretary and treasurer, Frank P. Alt; captain, Dayton P. Roth.

The members of the motorcycle club at Anderson, Ind., have elected the following officers: President, H. A. Kimberlin; vice president, Everett Vinson; secretary and treasurer, Ward Star; captain, T. Talmage; first lieutenant, R. Lindsey; second lieutenant, Sam Gray.

In order to keep motorcycling in the city clean and not a subject of police crusade, the Salt Lake City Motorcycle Club, Salt Lake City, Utah, has voted that each member seeing another member exceeding the speed limit, riding with open muffler or otherwise violating city ordinances, shall report to the club, which will try the guilty member and assess fines.

Yale Shows Splendid Economy.

Dr. S. W. Clark of Sterling, Ill., has reported an unusual reliability record for his Yale motorcycle, made by the Consolidated Manufacturing Company, Toledo, O. During 1912 he covered more than 7000 miles and says he did not have to touch his engine once. His machine was equipped with the extra large tires which characterize the Yale and Dr. Clark believes they will last through another season. He spent nothing for repairs.

Charles A. Langfitt of Shirley, W. Va., also has a fine record. He rode during the year over 10,000 miles on his Yale machine with a repair bill amounting to 95 cents. He covered all kinds of roads in all sorts of weather, but his machine still has the original tires.

INTRODUCING NEW PLUG.

Chas. E. Miller Makes Special Price During the Show Season.

Chas. E. Miller, the pioneer accessory man, distributed the Miller 1914 porcelain guaranteed spark plugs for 25 cents each during the commercial vehicle show at Madison Square Garden, New York City. This is an introductory price to introduce this plug to the general public and Mr. Miller would not sell any more than six plugs to any one at that price, which he established especially for all the local shows in the 16 cities where he has branch houses.

"Souvenirs of practical value at the shows are as scarce as hens' teeth," said Mr. Miller, and to further introduce his spark plugs to the motoring public everywhere who were unable to attend the shows, he announces that he will sell them at 50 cents each, mail prepaid, providing all mail orders are sent to his home office at 97-103 Reade street, New York City.

ENTRIES FOR SPEEDWAY RACE.

Albert Guyot in Sunbeam First Foreign Driver and Car to Be Announced.

Considering the fact that it is four months before the 500-mile race will be held at Indianapolis, Ind., on the motor speedway, there has been an unprecedented demand for tickets, which went on sale Jan. 1. The indications point to a record attendance this year and also to a big delegation from England. A large number of the prominent members of the Institution of Automobile Engineers and the Society of Motor Manufacturers & Traders, Ltd., will be in this country as the guests of the American Society of Automobile Engineers at the time the classic is run at Indianapolis and they will be present at the event. However, aside from these there are many English motorists interested in racing who have signified their intention of coming to this country to see the race and several touring parties will probably be formed.

Their decision no doubt was hastened by the fact that the famous French driver, Albert Guyot, has been secured to drive the well known English racing car, the Sunbeam, which until recently held the records from six to 12 hours, made on the Brooklands track. L. Coatalen, chief engineer of the Sunbeam Motor Works at Wolverhampton, England, made the arrangements with Guyot as a result of a recent conference with Charles W. Sedwick, director of the Indianapolis speedway, who went abroad in search of foreign entries. Guyot is one of the best drivers in Europe, having a long record of victories and with a Sunbeam car can be depended upon to make the American cars go their limit to win the coming race.

Other well known drivers in this country who have already been assured for the race are: Gilbert Anderson and another, Stutz; Harry Endicott, Nyberg; Ralph De Palma, Caleb Bragg and Spencer Wishart, Mercer; Ralph Mulford, Mason. Others will doubtless be heard from soon. This will be the first time in the history of the Nyberg Automobile Company, Anderson, Ind., that it has entered a car in any race. This car is now in course of construction under the personal direction of Harry Endicott.

ENGINEERS ELECT OFFICERS.

Howard Marmon, Designer of Marmon Cars, Becomes President of Society.

The annual winter meeting of the Society of Automobile Engineers was held in the Hotel McAlpin, New York City, Jan. 16-18, during the progress of the first week of the New York show. The various sessions were devoted to receiving and acting upon reports of committees and discussing papers on engineering subjects. The election of officers for the ensuing year resulted as follows: President, Howard Marmon, Nordyke & Marmon Company, Indianapolis, Ind.; first vice president, J. G. Perrin, Lozier Motor Company, Detroit; second vice president, Russell Huff, Packard Motor Car Company, Detroit; treasurer, Hermann F. Cuntz, New York City; members of the council, H. L. Pope, Pope Manufacturing Company, Hartford, Conn.; E. F. Russell, Locomobile Company of America, Bridgeport, Conn.; J. A. Anglada, New York City.

The annual dinner was held Friday evening, 517 members and invited guests being present. It was an occasion for a general good time, the speeches being limited to a statement of his policy for the coming year by President Marmon, and an address by Prof. F. R. Hutton concerning "The Society's True Ideals."

During the convention several topics of general interest were discussed, including the six-cylinder situation, gearbox location, low grade fuel for motor trucks, electric starting systems and the use of combined lighting, starting and ignition units.

JOINS ABBOTT COMPANY.

L. B. Sanders Becomes Manager of Sales for Maker of Abbott-Detroit Cars.

L. B. Sanders, the subject of the accompanying illustration, has just been appointed sales manager of the Abbott Motor Company, Detroit, maker of Abbott-Detroit cars. The appointment was effective Jan. 2, at which time Mr. Sanders entered actively upon his new duties. For the past two years he has been sales manager of the Lion Motor Car Company, Adrian, Mich., and was responsible in a large degree for bringing that company to the front. After the destruction of its plant by fire Mr. Sanders was actively engaged in the company's re-establishment until the project was abandoned in December.

L. B. Sanders, Sales Manager, Abbott Motor Company.

Previous to his connection with the Lion company, Mr. Sanders had held important sales positions with the United States Motor Company and the Reliance Motor Truck Company. Prior to the last named connection he conducted a thriving garage and sales business in New York City. While still a young man he has had a very wide business experience and is recognized as a man of decided executive ability. He is constructive in his methods and has a firmly established record as a business producer.

EXPORTS AND IMPORTS.

Governmental Report for 11 Months Shows an Increase of Nearly $8,000,000.

The report of the Department of Commerce and Labor for November shows that the exports of automobiles from this country increased nearly $500,000 over the corresponding month a year ago. The export trade with England, however, showed a perceptible decrease, while with Canada and several other countries the record showed sufficient increase to overbalance the loss. The following table gives the number and value of automobiles exported and imported during November:

Exports.

	1911		1912	
Country	No.	Value	No.	Value
France	19	$12,684	83	$62,727
Germany	11	6,584	46	32,197
Italy	4	2,445	13	16,279
United Kingdom	397	334,151	164	139,222
Other Europe	20	15,264	99	80,086
Canada	256	366,774	471	550,362
Mexico	52	81,309	35	51,494
West Indies and Bermuda	263	303,434	316	331,230
South America	143	163,824	273	346,995
British Oceania	312	269,333	263	265,820
Asia and other Oceania.	97	72,016	148	154,035
Other countries	26	25,980	51	59,735
Totals	1364	$1,382,804	1689	$1,807,066

Imports.

	1911		1912	
Country	No.	Value	No.	Value
France	32	94,291	42	108,356
Germany	18	41,768	11	28,206
Italy	18	22,897	19	25,952
United Kingdom	23	47,152	7	17,670
Other countries	5	8,025	8	18,167
Totals	96	$214,133	87	$198,351

For the 11 months ending November, 1912, the record of exports of automobiles shows an increase of nearly $8,000,000 over the corresponding 11 months of 1911. This is a particularly good record when it is considered that the imports during the same period showed a decrease in 1912 of about $101,000 over 1911. Following is the table of figures:

Exports.

	1911		1912	
Country	No.	Value	No.	Value
France	385	$425,714	668	$502,040
Germany	106	118,710	438	348,398
Italy	171	194,784	267	240,715
United Kingdom	3173	2,741,524	4371	3,302,918
Other Europe	705	650,642	1439	1,178,847
Canada	4556	5,137,685	6864	8,255,134
Mexico	262	432,316	233	372,086
West Indies and Bermuda	263	303,434	316	331,230
South America	909	1,131,182	1859	2,164,983
British Oceania	2041	1,871,716	3112	2,852,095
Asia and other Oceania.	742	719,083	1469	1,464,358
Other countries	247	264,141	671	630,463
Totals	13,560	$13,990,931	21,707	$21,643,177

Imports.

	1911		1912	
Country	No.	Value	No.	Value
France	294	$661,956	426	$1,022,995
Germany	147	322,153	56	133,337
United Kingdom	118	182,085	99	155,503
Canada	150	352,683	122	296,253
Other countries	160	352,537	78	163,847
Totals	869	$1,871,414	781	$1,771,935

Several South American coffee planters will doubtless require automobiles when the Empreza Autovioria Paulista Company builds an automobile road connecting Sao Paulo and Santos, Brazil, for which a loan of $650,000 has been floated by government permission.

AN ATTRACTIVE CATALOGUE.

That Describing Detroit Electric Cars Thoroughly in Keeping with the Product.

The year book illustrating and describing the Detroit electric line for 1913, issued by the maker, the Anderson Electric Car Company, Detroit, is a decidedly attractive booklet of 40 pages, designed, engraved and printed by the Cargill Company, Grand Rapids, Mich. The frontispiece is a reproduction of one of the enclosed cars in a landscape setting, the whole being in colors.

Other models are presented in similar settings throughout the book, although the colors are missing. Another portion is devoted to illustrations of the components and interior views, while a third presents the factory and branch offices of the company. The text matter fully describes the various models in a simple and comprehensive manner and sets forth the company's service methods in considerable detail.

MERCER'S RACING TEAM.

De Palma, Bragg and Wishart to Start in Speedway Event Memorial Day.

The Mercer Automobile Company, Trenton, N. J., maker of Mercer cars, is one of the most earnest supporters of properly planned and well conducted motor car races. This is due, so the officials state, to the fact that in such contests, a car must be able to stand strains that would never be imposed upon it in ordinary touring. It is their opinion that racing has done much more to develop the automobile than have ordinary tours.

The Mercer racing team for the coming season will consist of Ralph De Palma, Caleb Bragg and Spencer E. Wishart. The first contest in which the new team will appear will be the 500-mile international sweepstakes at Indianapolis, Ind., May 30. The Mercer company is now building racing cars for these drivers at its factory in Trenton, N. J.

D. S. Menasco, vice president of the American Motors Company, Indianapolis, Ind., maker of American machines, is the first to file a formal entry blank for the proposed tour of the Indiana Automobile Manufacturers' Association, from Indianapolis to San Francisco, in July. Two American cars have been entered.

COMING EVENTS.

¶ High flash and fire tests
¶ High Baume gravity
¶ Highly filtered and not acid treated
¶ Proper "body" or viscosity
¶ A "straight run" product
¶ Made only from Pennsylvania crude
¶ All these points are considered essential to a good automobile cylinder oil and are all found in

MONOGRAM OIL

¶ And what is really important to all dealers is that we protect the trade and refer inquiries and orders to those dealers who handle our products.

Cut Your Gasoline Bills In Half!

By Using the M&M Economizer

The M&M is nickel plated and highly polished. It requires a 3-4 inch pipe tap to insert into manifold. It will increase your speed and power 20 per cent. with less gasoline and less carbon. Will POSITIVELY save you from 40 to 50 per cent. of gasoline. It is the only known carbureter adjuster on the market, and can be used for priming the engine.

BEWARE OF INFRINGEMENTS!

Your Money Will Be Refunded in Thirty Days if the M&M is Unsatisfactory

Gallon Less Per Hour!

Mr. Smith saves $2.00 every 10 hours on basis of 20c gas, and gets better control.

YOU CAN SAVE

10% to 25%

Gasoline on your Automobile

Ask your dealer to put one on your car at our expense.

Sold only on a satisfaction or money back basis.

20 Miles to Gallon

G. A. Schmidt, Lawrence, gets 20 miles to gallon on his car.

4300 Miles Without Miss

The "Dreams" owner claims 4300 miles without one moment's trouble.

Power

The Planhard was on the motor winning the great ploughing contest in Argentine—$3000 prize.

Mr. Smith's Letter

THE GRAY & PRIOR MACHINE CO.
Portland Branch
117 Commercial Street, Portland, Me.

Planhard Mfg. Co.,

Gentlemen: I used one of your Planhard carburetors on the 20 h. p. model X Hartford motor in my semi-speed boat Hartford III during 1912.

My boat is well equipped to make tests, as I use a tachometer.

I get better control with a Planhard and use **practically one gallon of gasoline less per hour** than when I used one of the most popular carburetors in use today. I have put a Planhard on my automobile as well.

Very truly yours,
A. N. Smith.

You can get all the power your motor can give by using a Planhard.

Compare its simplicity with that of any other carburetor !!

Absolutely automatic. No springs, valves or cams. Permanent adjustment. Gives increased power and speed with any gas in any weather. Send for chart and book showing mileage when Planhard will have paid for itself on your car.

DEALERS, Send for our proposition.

PLANHARD MFG. CO.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. TRY THEM NOW.

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "Invader" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

CHAS. F. KELLOM & CO., 113 Arch Street, Philadelphia; Branch: 719 N. Broad Street

NEW ENGLAND BRANCH, 284 Columbus Ave., BOSTON, MASS.

Prime Your Motor

If you have "ALL-IN-ONE" Spark Plugs you can quickly prime your motor and easily start it on the very coldest morning. Easy priming is only one of the advantages given by the "ALL-IN-ONE" Petcock. Open the petcock while the motor is running and all soot will be blown off the sparking points—a true *self-cleaning plug*. Open the petcocks when the motor is missing and you'll quickly detect which cylinder is giving trouble—a *real trouble finder*. Open the petcock and inject a little Kerosene—this is the *best carbon remover* ever tried.

"ALL-IN-ONE" has the best features of other plugs and the Petcock besides.

Price $1.50 each.

We shall prosecute vigorously all infringements now on the market or any which may spring up in the future.

FRONTIER SPECIALTY CO.

732 Main Street BUFFALO, N. Y.

All sizes and types to fit every kind of motor made

Classified Buyers' Guide

To facilitate selection in purchasing Motor Cars, Motorcycles, Accessories, Parts, Supplies, Fittings and Attachments, as well as Aviation Equipment, we present the following list of representative and progressive advertisers in our publications, addresses of their main and branch houses and the line of products handled by each.

ACCESSORY MANUFACTURERS AND JOBBERS.

Caldwell Mfg. Co., 1756 Cranston St., Providence, R. I.
Hawthorne Mfg. Co., 29 Spruce St., Bridgeport, Conn.
Hopewell Brothers, Newton, Mass.
Branch: 1974 Broadway at 67th St., New York.
Miller, Chas. E., 97-103 Reade St., New York.
Branches: 202-204 Columbus Ave., Boston; Bridge and Dwight streets, Springfield, Mass.; 274 Trumbull St., Hartford, Conn.; 924 Eighth Ave., and 2782 Broadway, New York; 1421 Bedford Ave., Brooklyn, N. Y.; 318 North Broad St., Philadelphia; 824 Main St., Buffalo, N. Y.; 1829 Euclid Ave., Cleveland; 227 Jefferson St., Detroit; 259 Peachtree Street., Atlanta, Ga.; 601-603 Baronne St., New Orleans, La.; 135 Central Ave., Albany, N. Y.; 274 Halsey St., Newark, N. J.
Milwaukee Auto Specialty Co., 128 Second St., Milwaukee, Wis.
Waite Auto Supply Co., 81 Exchange place, Providence.

ACETYLENE TANKS. (See Tanks.)

AIR COMPRESSORS AND TANKS.

Williams Foundry & Machine Co., Akron, O.

AUTOMOBILES. (See Cars.)

AUTOMOBILE SPECIALTIES.

Sumner George, Inc., 1841 Broadway, New York.

BALLS AND BALL BEARINGS.

Boyd, F. Shirley, 903 Boylston St., Boston. (R. I. V.)
Brots Co., J. S., 250 W. 54th St., New York. (F. & S.)
Marburg Bros., Inc., 1786 Broadway, New York. (S. K. O.)
New Departure Mfg. Co., Bristol, Conn. (New Departure.)
R. I. V. Co., 1771 Broadway, New York. (R. I. V.)

BATTERIES.

Geissler Bros. Storage Battery Co., 514 W. 57th St., New York.
Lincoln Electric Co., 1007 Atlantic Ave., Brooklyn, N. Y. (Hi-Po Waterproof Dry.)
Waite Auto Supply Co., 81 Exchange place, Providence. (Success.)
Willard Storage Battery Co., 5716 Euclid Ave., Cleveland. (LBA.)
Branches: 136 West 52nd St., New York; 1191 Woodward Ave., Detroit; 2241 Michigan Ave., Chicago; 243 Monadnock Bldg., San Francisco.

BLOW-OUT PATCHES. (See Patches.)

BODIES, TRUCK.

Lynch Manufacturing Co., Hammond, Ind.
Branches: East Chicago, Ind.; South Chicago, Ill.
Motor Truck Body Co., 320 Franklin St., Detroit.

BODIES—WOOD AND METAL.

Springfield Metal Body Co., 20 Medford Ave., Springfield, Mass.

BRAKE BANDING OR LINING.

Royal Equipment Co., The, 422 Housatonic Ave., Bridgeport, Conn. (Raybestos.)
Standard Woven Fabric Co., Worcester, Mass. (Multibestos.)
Branches: 903 Boylston St., Boston; 287 Lafayette St., New York; 720 Main St., Buffalo; 422 River St., Troy, N. Y.; 1427 Vine St., Philadelphia; 1430 Michigan Blvd., Chicago; 1598 Woodward Ave., Detroit; St. Louis; San Francisco.

BRAKES.

Royal Equipment Co., The, 422 Housatonic Ave., Bridgeport, Conn. (Duplex.)

BRUSHES, WIRE.

Williams Foundry & Machine Co., Akron, O.

BUMPERS AND FENDERS.

Sager Co., J. H., 271 South Ave., Rochester, N. Y. (Diamond.)

CABLES. (See Wires.)

CARBURETORS.

Mayer Carburetor Co., 2673 Main St., Buffalo, N. Y. (Mayer.)
Planhard Mfg. Co., 1790 Broadway, New York. (Planhard.)

CARBURETION EXPERT.

Sumner, George, Inc., 1841 Broadway, New York.

CARS—ELECTRIC PLEASURE.

Anderson Electric Car Co., 458 Clay Ave., Detroit. (Detroit Electric.)

CARS—GASOLINE PLEASURE.

Austin Automobile Co., Grand Rapids, Mich. (Austin.)
Brush Runabout Co., 3 West 61st St., New York. (Brush runabout, Liberty-Brush.)
Buckeye Manufacturing Co., Anderson, Ind. (Lambert.)
Cartercar Co., Pontiac, Mich. (Cartercar.)
Cole Motor Car Co., Indianapolis, Ind. (Cole.)
Columbia Motor Car Co., 3 West 61st St., New York. (Columbia.)
Croxton Motor Car Co., Washington, Penn. (Croxton.)
Cutting Motor Car Co., Jackson, Mich. (Cutting.)
Dayton Motor Car Co., 3 West 61st St., New York. (Stoddard-Dayton.)
Empire Automobile Co., Indianapolis, Ind. (Empire, Little Aristocrat.)
Haynes Automobile Co., 166 Main St., Kokomo, Ind. (Haynes.)
Herreshoff Motor Co., 620 Harper Ave., Detroit. (Herreshoff.)
Hupp Motor Car Co., 1268 Milwaukee Ave., East, Detroit. (Hupmobile.)
Branches: Detroit, Buffalo, Chicago, Cleveland, Denver, Kansas City, Los Angeles, Minneapolis, Philadelphia.
Ideal Motor Car Co., Indianapolis. (Stutz.)
Imperial Automobile Co., Jackson, Mich. (Imperial.)
Jackson Automobile Co., 1400 Main St., Jackson, Mich. (Jackson.)
Kissel Motor Car Co., 174 Kissel Ave., Hartford, Wis. (KisselKar.)
Knox Automobile Co., Springfield, Mass. (Knox.)
K-R-I-T Motor Car Co., Detroit. (K-R-I-T.)
Lenox Motor Car Co., Inc., Boston. (Lenox.)
Branches: New York, Boston, Chicago.
Maxwell-Briscoe Motor Co., 3 West 61st St., New York. (Maxwell.)
Mercer Automobile Co., 1100 Whitehead Road, Trenton, N. J. (Mercer.)
Michigan Motor Car Co., 147 Lay St., Kalamazoo, Mich. (Michigan.)
National Motor Vehicle Co., 1033 22d St., Indianapolis. (National.)
Nordyke & Marmon Co., Indianapolis. (Marmon.)
Owen & Co., R. M., 19 W. 62d St., New York City. (Reo.)
Paige-Detroit Motor Car Co., Detroit. (Paige-Detroit.)
Peerless Motor Car Co., Cleveland. (Peerless.)
Branches: 660 Beacon St., Boston; Broadway and 57th St., New York; Michigan Ave., and 25th St., Chicago.
Pierce-Arrow Motor Car Co., Buffalo, N. Y. (Pierce-Arrow.)
Reo Motor Car Co., Lansing, Mich. (Reo.)
Sampson Mfg. Co., Alden, 3 West 61st St., New York. (Sampson.)
Selden Motor Vehicle Co., Rochester, N. Y. (Selden.)
Speedwell Motor Car Co., 80 Essex Ave., Dayton, O. (Speedwell.)
Studebaker Corporation, Detroit. (E-M-F and Flanders.)
United States Motor Co., 3 West 61st St., New York. (Brush, Maxwell, Sampson, Stoddard-Dayton, Columbia.)
Warren Motor Car Co., Detroit. (Warren-Detroit.)
White Co., The, 828 E. 79th St., Cleveland. (White.)
Branches: 320 Newbury St., Boston; Broadway and 62nd St., New York; 629-633 North Broad St., Philadelphia; 138-148 Beatty St., Pittsburg, Penn.; 610 S. Michigan Ave., Chicago; Market St. and Van Ness Ave., San Francisco; 120-122 Marietta St., Atlanta, Ga.; 74 Victoria St., Toronto, Can.
Willys-Overland Co., Toledo, O. (Overland.)

CARS—STEAM PLEASURE.

White Co., The, 828 E. 79th St., Cleveland. (White.)
Branches: See Cars—Gasoline Pleasure.

CARS—GASOLINE COMMERCIAL.

Adams Bros. Co., Findlay, O. (Adams.)
Available Truck Co., 2334 Hamilton Ct., Chicago. (Available.)
Bessemer Motor Truck Co., Grove City, Penn. (Bessemer.)

A Powerful Electric Starter

Now Standard Equipment on *Peerless* **Motor Cars**

PRESSURE ON A PEDAL

STARTS THE ENGINE

THERE has been added to the already exceptionally com plete equipment of Peerless Motor Cars, the GRAY & DAVIS ELECTRIC STARTER, a powerful device that will invariably crank the engine, spinning it, if necessary, for thirty minutes.

This ELECTRIC STARTER is extremely simple. It consists of a motor of very exceptional efficiency geared to the fly-wheel. As it uses the 6 volt current of the Dynamo Electric Lighting System, there are no complicated electrical controls — only a simple switch. The battery for starting and lighting is charged automatically and without expense by the dynamo.

PEERLESS 1913 MODELS
Equipped with Electric Starter

"38-Six," $4,300 "48-Six," $5,000 "60-Six," $6,000

Cutting Down the Up-keep Cost

Rock-Bottom Talks on Easy Motoring—No. 5

UP-KEEP cost is the nightmare of the average motorist and rapid depreciation is a shadow on his path. Repairs to the engine and the mechanism of a modern car, the tearing of tires, spring breakage and constant wear—all these eat a big hole in the pocketbook.

This **unnecessarily** heavy up-keep cost, as well as the depreciation of your car, can be **cut in two** and at the same time the pleasure of motoring can be **doubled.** That's the actual, day by day, result for owners who use Truffault-Hartford Shock Absorbers.

It's Because They Control Your Springs

Of course, it would be ideal if springs needed no control. But this ideal is so remote, that to insure easy riding, safety, speed and economy, 27 leading makers find it wise to equip all their cars with the Truffault-Hartford.

It's easy to understand why.

Most cars have at least 2000 moving parts. Harm to one part interferes with the efficiency of the other 1999 parts. Just consider this a moment: every time a 3000 pound car at 20-mile speed strikes a road bump only 2 inches high, such as an ordinary crosswalk, it receives a blow of over 4000 pounds.

Think of the straining bounds through the air and the crashes back onto the roadway, common on any ordinary road.

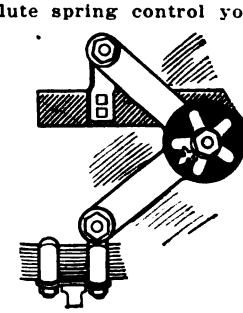
Think of the hundreds of delicate moving parts under this terrific strain of speed and heat and hammering.

It's this sort of thing that leads wise manufacturers to put Truffault-Hartfords on every car they make.

The Big Saving on Tires and Springs

Not only on the car's moving parts can you make a big saving, but also on tires and springs. On tires—because by eliminating the violence of the rebound, the Truffault-Hartford Shock Absorber keeps a car **on the ground.** Thus it reduces the "jump" of the tires and the accompanying tear. On springs—because its 11-year record proves that it is practically impossible for a spring to break on a Truffault-Hartford equipped car.

It's by saving repairs in all these ways that Truffault-Hartfords cut up-keep cost in two.



Control Springs Without Stiffening

The Truffault-Hartford is the **only** Shock Absorber which allows springs **full play, not free play**—thus controlling the springs' rebounds **without stiffening the springs.**

It has been conclusively proved by experts and users that the principle of **rotary friction,** applied **easily** and **constantly,** is absolutely necessary to a Shock Absorber's efficient service. The Truffault-Hartford is the **only** Shock Absorber employing this principle. And no one else can use this application of rotary friction because it is protected by patents.

In the preceding "talks" of this series it has been shown that the attachment of the Truffault-Hartford device to any car means more **comfort,** greater **safety** and greater **speed.** Why don't **you** enjoy more comfort—increase your car's speed—put a premium on safety—and also **cut down your motoring expenses.**

It is all possible with absolute control of the springs. And to get absolute spring control you **must** use the Truffault-Hartford. For no other device is either right in theory or **able** in practice to do the work.

Learn about **all** the advantages of this unique Shock Absorber in our new illustrated catalog. **Your copy** will be sent for the asking. **Write today.** Meantime, your dealer will be glad to explain the value of this device to you. Four Models: $60—$45—$25—$15.

PAWTUCKET, R. I.

August 25, 1912

Repair shop records show that the wrist pins and connecting rod bearings are the first parts of an automobile to feel the effect of improper lubrication.

Both of these parts are out of sight.

The motorist cannot tell whether they are properly or improperly lubricated until the trouble comes. When it does come, the trouble is serious.

That indicates the importance of selecting the right lubricating oil in advance.

The correct oil can't be determined by simple tests. The motorist must rely on authoritative guidance.

In producing Gargoyle Mobiloils, we made a detailed study of the motor construction of every American automobile and many foreign makes. The several grades of Gargoyle Mobiloils are made to meet the individual characteristics of each type of motor.

In buying Gargoyle Mobiloils, you will find the grade indicated on the can directly below the Gargoyle (our mark of manufacture), and the word "Mobiloil." By buying in barrels, half barrels, five or one gallon cans you can always be sure that you have the correct oil and the correct grade for your motor.

Gargoyle Mobiloils are handled by the higher class garages, auto-supply stores and others who supply lubricants.

Our complete list of recommendations showing the correct grade of oil for every American car, and many foreign makes, will be sent you on request.

How crank-case heat affects lubrication

WHEN your car is in action the lubricating oil heats up and thins out.

Its real lubricating value is then put to the test.

Oils not of the highest quality thin out to the danger point and lose their ability to protect the moving parts. The action of the motor is restrained. Destructive friction starts.

Many a motorist owes his repair bills to the failure of his lubricating oil under the heat of service.

The quality of the several grades of Gargoyle Mobiloil provides in advance for this heat of service. It assures efficient lubrication under the heat and mechanical conditions in each type of motor.

Our complete chart, showing the correct grade of Gargoyle Mobiloils for 400 cars, mailed you on request.

Gargoyle Mobiloils were produced after careful study by an organization recognized as the authoritative leaders in scientific lubrication—the Vacuum Oil Company.

In quality Gargoyle Mobiloils set a world standard.

By the gallon they cost a little more than ordinary lubricating oils. But their wearing quality makes them actually lowest in cost per mile—to say nothing of the lengthened life that they will give your motor.

The various grades, refined and filtered to remove free carbon, are:

Gargoyle Mobiloil "A" **Gargoyle Mobiloil "D"**
Gargoyle Mobiloil "B" **Gargoyle Mobiloil "E"**
Gargoyle Mobiloil "Arctic"

They are put up in 1 and 5 gallon sealed white cans, in half-barrels and barrels.

All are branded with the Gargoyle, which is our mark of manufacture.

They are handled by the higher class garages, automobile supply stores, and others who supply lubricants.

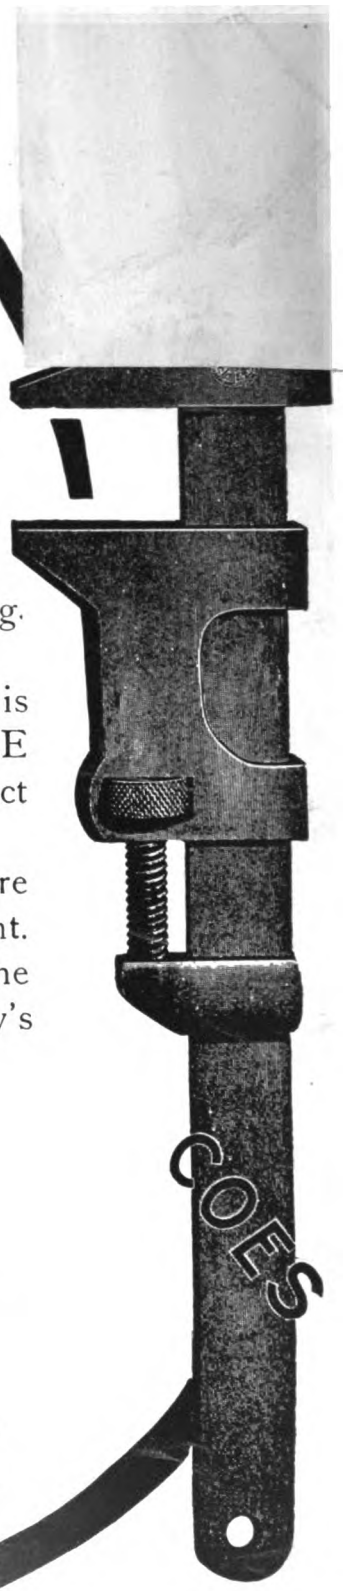
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

10 Cents the Copy.

PAWTUCKET, R. I.

Jan. 10, 1913

You selected a car that suits you. Now select an oil that suits your car.

Perhaps your car is a Packard. You should have an oil that suits the Packard engine.

Or it may be a Fiat. That necessitates a different kind of oil.

If it happens to be a White Steamer your lubrication requirements are still different.

Different dealers handle different kinds of oil. How will you know which oil to select?

There is one sound way out of this difficulty.

Go to the dealer who handles Gargoyle Mobiloils. He has our chart of recommendations.

He will refer to the chart. "For your Packard," he will say, "I have 'Gargoyle Mobiloil Arctic.' It is the grade recommended for your car by the Vacuum Oil Company."

No matter who made your car, the dealer in Gargoyle Mobiloils is prepared to furnish you a grade of lubricating oil distinctly fitted to its type of motor.

Our complete chart of recommendations covers the lubricating needs of every American car and most of the foreign makes. A copy will be sent you on request.

Gargoyle Mobiloils were produced by the recognized leaders in scientific lubrication after careful study of every American automobile and practically every foreign make.

In lubricating quality they set a world standard.

The various grades, refined and filtered to remove free carbon, are:

Gargoyle Mobiloil "A" **Gargoyle Mobiloil "D"**
Gargoyle Mobiloil "B" **Gargoyle Mobiloil "E"**
Gargoyle Mobiloil "Arctic"

They are put up in 1 and 5 gallon sealed white cans, in half-barrels and barrels.

All are branded with the Gargoyle, which is our mark of manufacture.

They are handled by the higher class garages, automobile supply stores, and others who supply lubricants.

Mobiloil

A grade for each type of motor.

The Largest Automobile Supply House in America.

Our Name Is Your Guarantee

WHATEVER you buy from the house of Chas. E. Miller you may expect the fullest degree of satisfaction in every detail. Quality, quantity, material, workmanship, durability will be just right or we will make it right. Our name is your guarantee.

To buy from a house the size and standing of this one is the safest way to insure complete satisfaction in all your dealings. We handle goods of standard quality only and of course stand back of everything we sell.

No matter what you want in the line of automobile accessories or supplies, remember our slogan, "We Either CARRY IN STOCK, WILL GET IT—OR IT ISN'T MADE." One of the prize winners in Motor's recent advertising contest selected this as the slogan out of the many shown. His reason was as follows: "This saying is the clearest possible statement of the Miller business policy which I have found to be a fact through several years of satisfactory relations with them."

Our Annual Catalog is the largest, most complete, up-to-date and authoritative dictionary of the auto supply market of any book published. It has come to be recognized as one of the standard reference works of the industry.

The total distribution of one hundred thousand copies of this catalog practically covers the world, at least wherever automobiles are used. Nearly all foreign as well as domestic automobile manufacturers and dealers, the offices of American Consuls, Public Libraries, Universities, Y. M. C. A. Schools, Publishers, Automobile Clubs, Engineer's Offices, Purchasing Departments—in all these places you will find a copy of the Miller catalog on file.

Fifteen branches spread over the United States, located in the principal motoring centers, bring Miller service within the reach of practically every motorist in the United States. Prompt delivery, perfect quality, honest prices---these are the things that distinguish Miller service and explain the marvelous growth of this pioneer establishment since its inception in 1896.

Catalog Mailed to Anyone, Any Place, On Request.
